Proficiency Test Final Report

AQA 21-07

PFAS in Soil and Water

February 2022

ACKNOWLEDGMENTS

This study was conducted by the National Measurement Institute (NMI). Support funding was provided by the Australian Government Department of Science, Energy and Resources.

I would like to thank the management and staff of the participating laboratories for supporting the study. It is only through widespread participation that we can provide an effective service to laboratories.

The assistance of the following NMI staff members in the planning, conduct and reporting of the study is acknowledged.

SUMMARY

This report presents the results of the proficiency test AQA 21-07 PFAS in Soil and Water. This study is focused on the measurement of 34 per- and polyfluorinated alkyl substances (PFAS): PFBS, PFPeS, PFHxS, PFHpS, PFOS, PFNS, PFDS, PFUdS, PFDoS, PFTrDS, PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFNA, PFDA, PFUdA, PFDoA, PFTrDA, PFTeDA, PFOSA, MeFOSA, EtFOSA, MeFOSAA, MeFOSE, 6:2 FTS, 8:2 FTS, GenX, ADONA, 9Cl-PF3ONS and 11Cl-PF3OUDS in soil and water. The measurement of PFOS total and PFOS linear (PFOS_L) as well as of PFHxS total and PFHxS linear (PFHxS_L) were also included in the program.

Thirty-three laboratories participated and all submitted results.

Four test samples were prepared at the NMI North Ryde laboratory and consisted of:

- two soil samples: Sample S1 with incurred PFAS contaminants, and Sample S2 spiked with 22 individual PFAS components; and
- two water samples: Sample S3 with incurred PFAS contaminants, and Sample S4 spiked with 26 individual PFAS components.

The assigned values were the robust averages of participants' results. The associated uncertainties were estimated from the robust standard deviations of the participants' results.

The outcomes of the study were assessed against the aims as follows, to:

- i. *compare the performances of participant laboratories and to assess their accuracy in the measurement of PFAS in soil and water;*

Laboratory performance was assessed using both z-scores and E_n-scores.

Of 1818 z-scores, 1654 (91%) returned |z| ≤ 2.0, indicating a satisfactory performance.

Of 1818 E_n-scores, 1461 (80%) returned |E_n| ≤ 1.0, indicating agreement of the participant's result with the assigned value within their respective expanded uncertainties.

Laboratory **25** received satisfactory z-scores for all of the analytes for which z-scores were calculated (71). Laboratory **12** returned 70 satisfactory z-scores out of the 71. All results reported by laboratories **8** (68), **24** (67), **3** (65), **27** (64), **15** (52), **11** (27) and **33** (4) returned satisfactory z-scores.

Laboratory **25** had the highest number of satisfactory E_n-scores (71 out of 71). Laboratories **27**, **15** and **33** returned satisfactory E_n-scores for all analytes reported.

- ii. *evaluate the laboratories' methods for PFAS in soil and water analysis;*

Five laboratories reported at least one PFAS analyte that was not spiked into the test samples by the study coordinator.

PFDS presented analytical difficulty to participating laboratories in both matrices.

A limited number of laboratories have the capability to measure PFUdS, PFDoS and PFTrDS in water.

Due to the limited amount of data and wide variety of analytical methods used, no significant trends in extraction and sample preparation could be identified.

- iii. *compare the performance of participant laboratories with their past performance;*

Over the last 7 years, laboratories have developed methods for the analysis of a wide spectrum of PFAS contaminants and in general the results reported were compatible with each other. Over this period, the average proportion of satisfactory scores was 88% for z-scores and 76% for E_n-scores.

- iv. develop the practical application of traceability and measurement uncertainty and provide participants with information that will be useful in assessing their uncertainty estimates.*

Of 1962 results, 1908 were reported with an associated estimate of expanded measurement uncertainty. The magnitude of the reported expanded uncertainties was within the range 0% to 727% of the reported value

- v. produce materials that can be used in method validation and as control samples.*

Surplus test samples from the present study are available for sale. The samples are homogeneous and well characterised, both by in-house testing and from the results of the proficiency round.

A reference material for PFAS analytes in soil (MX019) is also available for sale from NMI.

1 INTRODUCTION

1.1 NMI Proficiency Testing Program

The National Measurement Institute (NMI) is responsible for Australia's national measurement infrastructure, providing a range of services including a chemical proficiency testing program.

Proficiency testing (PT) is the: 'evaluation of participant performance against pre-established criteria by means of interlaboratory comparison.'¹ NMI PT studies target chemical testing in areas of high public significance such as trade, environment, law enforcement and food safety. NMI offers studies in:

- pesticide residues in fruit and vegetables, soil and water;
- petroleum hydrocarbons in soil and water;
- PFAS in soil, water, biota and food;
- inorganic analytes in soil, water, food and pharmaceuticals;
- controlled drug assay; and
- allergens in food.

1.2 Study Aims

The aims of the study were to:

- compare the performances of participant laboratories and assess their accuracy in the measurement of PFAS in soil and water matrices;
- evaluate the laboratories' test methods;
- develop the practical application of traceability and measurement uncertainty and provide participants with information that will be useful in assessing their uncertainty estimates; and
- produce materials that can be used in method validation and as control samples.

1.3 Study Conduct

The conduct of NMI proficiency tests is described in the NMI Study Protocol for Proficiency Testing.² The statistical methods used are described in the NMI Chemical Proficiency Testing Statistical Manual.³ These documents have been prepared with reference to ISO/IEC 17043¹ and The International Harmonized Protocol for the Proficiency Testing of Analytical Chemistry Laboratories.⁴

NMI is accredited by the National Association of Testing Authorities, Australia (NATA) to ISO/IEC 17043 as a provider of proficiency testing schemes. This study falls within the scope of NMI's accreditation.

2 STUDY INFORMATION

2.1 Study Timetable

The timetable of the study was:

Invitation issued	5 July 2021
Samples dispatched	3 August 2021
Results due	8 October 2021
Interim report issued	18 October 2021

2.2 Participation

Thirty-three laboratories participated in this study, and all submitted results. The laboratory with the Lab code 1 cancelled its participation.

2.3 Test Material Preparation

Four test samples were provided for analysis.

- Two soil samples S1 and S2 each containing 20 g:
 - Sample S1 containing incurred PFAS contaminants; and
 - Sample S2 spiked with 22 individual PFAS components.
- Two water samples S3 and S4 each containing 2 x 50 mL:
 - Sample S3 containing incurred PFAS contaminants; and
 - Sample S4 autoclaved milli-Q water spiked with 26 individual PFAS components.

The bulk water sample S4 was spiked with 18 analytes using a composite solution that was then mixed and dispensed into 65 mL HDPE bottles. Each bottle was then further spiked with a composite solution containing PFUdA, PFDoA, PFTrDA, PFTeDA, PFUdS, PFDoS, PFTrDS and PFOSA, with the aim of minimising the loss of these analytes during preparation (see details in Appendix 1).

Four PFAS analytes, PFUdS, PFDoS, PFTrDS and 11Cl-PF3OUdS, were introduced for the first time in this PT study.

The analytical standards used for spiking these samples were purchased from HPC Standards GmbH, Toronto Research Chemicals, and Wellington Laboratories Canada.

Details of the spiked analytes and levels are presented in Table 1 and sample preparation details in Appendix 1.

Table 1 Formulated concentrations of test samples

PFAS	S2 Soil (Spiked) µg/kg	S4 Water (Spiked) µg/L

GenX	15.0	0.0698
ADONA	47.1	0.0659
9Cl-PF3ONS	37.3	0.0839
11Cl-PF3OUdS	58.1	0.0565

2.4 Test Material Homogeneity and Stability Testing

The preparation of the study samples is described in Appendix 1. No homogeneity or stability testing was conducted on soil and water samples. These samples were prepared and packaged using a process that has been demonstrated to produce homogeneous and stable samples in previous NMI PFAS PTs. Participants' results gave no reason to question the homogeneity and stability of the previously used analytes. However, there were stability issues in this study with regards to GenX in S2. Possible reasons for the instability of these analytes are presented in section 6.7. A reasonable consensus was found between participants' results and consequently an assigned value was set for these tests.

2.5 Sample Storage, Dispatch and Receipt

Prior to dispatch, soil and water samples were refrigerated at 4°C.

Participants were sent 20 g soil in Greiner tubes for each of Samples S1 and S2, and two 50 mL water in HDPE bottles for each of Samples S3 and S4. The samples were packed in a foam box with a cooler brick and sent by courier on 03 August 2021.

The following items were packaged with the samples:

- a covering letter which included a description of the test samples and instructions for participants; and
- a form for participants to confirm the receipt and condition of the samples.

An Excel spreadsheet for the electronic reporting of results was e-mailed to participants.

2.6 Instructions to Participants

Participants were instructed as follows:

- Quantitatively analyse the samples using your routine test method.
- Report results in units of µg/kg on an as received basis for PFAS in soil samples S1 and S2, and in units of µg/L for PFAS water samples.
- For water samples S3 and S4, use the entire content of the bottle for analysis. The second bottle is provided for repeat analysis.
- For PFAS analytes that contain linear and branched isomers, report TOTAL – the sum of linear and branched.

- For PFOS and PFHxS you are asked to report TOTAL (the sum of linear and branched isomers) and LINEAR (the linear isomers only).
- The analytes range for PFAS in S1 is 0-2000 µg/kg, in S2 is 0-200 µg/kg, in S3 is 0-500 µg/L, and in S4 is 0-50 µg/L.
- Report results using the electronic results sheet emailed to you.
- For each analyte, report a single result expressed as if reporting to a client (i.e. corrected for recovery or not, according to your standard procedure, but state if results are corrected on the result sheet). This figure will be used in all statistical analysis in the study report.
- For each analyte report the associated expanded measurement uncertainty (e.g. 0.50 ± 0.02 µg/kg), if determined.
- No limit of reporting has been set for this study. Report results as you would to a client, applying the limit of reporting of the method used for analysis.
- Report any listed analyte not tested as NT.
- Please complete the method details and report the basis of your uncertainty estimates as required by the results sheet.
- If determined, report your internal standard percentage recovery. This will be presented in the report for information only.
- Return the completed results sheet by e-mail (proficiency@measurement.gov.au) by 10 September 2021. Late results may not be included in the study report.

Due to the exceptional international circumstances occurring over the course of this study, the results due date was extended to 08 October 2021 for all participants.

2.7 Interim Report

An interim report was emailed to all participants on 18 October 2021.

3 PARTICIPANT LABORATORY INFORMATION

3.1 Test Methods Reported by Participants

Participants were requested to provide methodology information. Responses are presented in Appendix 5 for soil and Appendix 6 for water. The study coordinator thanks participants for completing the questionnaire.

3.2 Basis of Participants' Measurement Uncertainty Estimates

Participants were requested to provide information about their basis of measurement uncertainty (MU). Responses are presented in Tables 2 and 3.

17	Soil samples were extracted alongside both spiked soil and reference soil. Uncertainty calculated as 3 x SD of replicate analysis.
21	Standard practice for laboratories utilizing US EPA's SW-846 document.
24	Measurement Uncertainty (U) estimated from the standard deviation (u) of replicate recovery samples using the expression $U = 2 \times u$. Procedure as set out in Statistics and Chemometrics for Analytical Chemistry, Miller and Miller, 5th Edition
28	MU is calculated based historic QC data

3.3 Participants' Comments

Participants were invited to make comments for this PT study. Such feedback allows for the improvement of future studies. Participants' comments are presented in Table 4, along with the study coordinator's response where appropriate.

Table 4 Participants' Comments

Lab Code	Participants' Comments	Study manager's response
14	Suggest considering proficiency trial for leachable PFAS (ASLP/TCLP).	Thank you for your suggestions. The other participants are invited to comment.

4 PRESENTATION OF RESULTS AND STATISTICAL ANALYSIS

4.1 Results Summary

Participant results are listed in Tables 5 to 85 with resultant summary statistics: robust average, median, maximum, minimum, robust standard deviation (SDrob) and robust coefficient of variation (CVrob). Bar charts of results and performance scores are presented in Figures 2 to 82. An example chart with interpretation guide is shown in **Error! Reference source not found..**

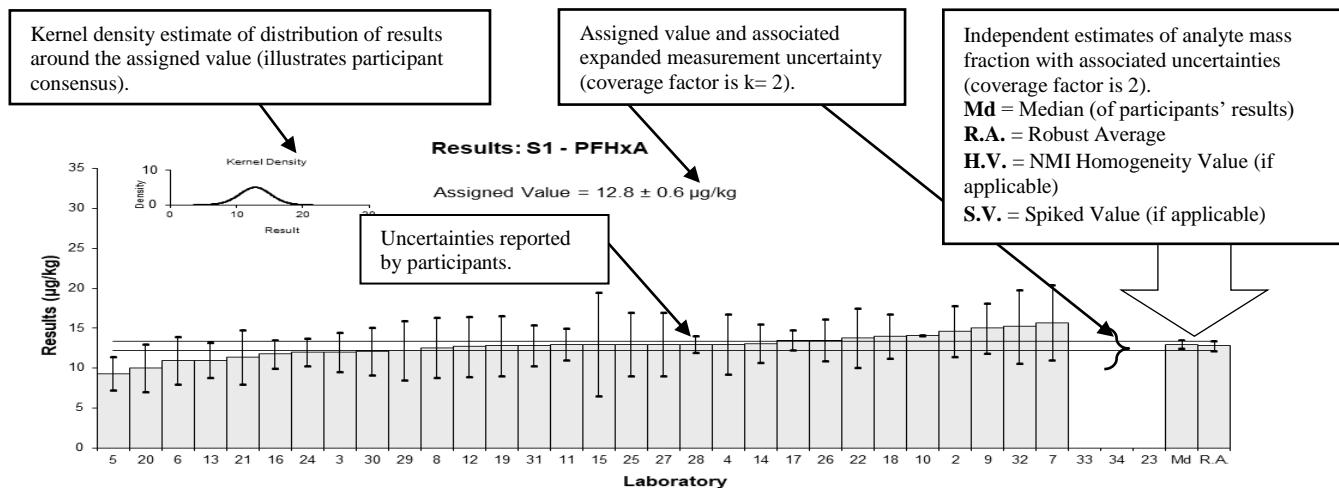

Figure 1 Guide to Presentation of Results

4.2 Outliers and Extreme Outliers

Outliers were results less than 50% and greater than 150% of the robust average and were removed before assigned value calculation. Extreme outliers were obvious blunders, such as those with incorrect units, decimal errors, or results from a different proficiency test item (gross errors) and were removed for calculation of summary statistics.^{3,4}

4.3 Assigned Value

An example of the assigned value calculation using data from the present study is given in Appendix 2. The assigned value is defined as: ‘the value attributed to a particular property of a proficiency test item’.¹ In this study the property is the mass concentration of analyte. Assigned values were the robust average of participants’ results; the expanded uncertainties were estimated from the associated robust standard deviations.^{4,5}

4.4 Robust Average and Robust Between-Laboratory Coefficient of Variation

The robust averages and associated expanded measurement uncertainties were calculated using the procedure described in ‘Statistical methods for use in proficiency testing by interlaboratory comparisons, ISO13528:2015(E)’.⁵

4.5 Target Standard Deviation for Proficiency Assessment

The target standard deviation for proficiency assessment (σ) is the product of the assigned value (X) and the performance coefficient of variation (PCV). This value is used for calculation of participant z-score and provides scaling for laboratory deviation from the assigned value.

$$\sigma = (X) \times \text{PCV} \quad \text{Equation 1}$$

It is important to note that the PCV is a fixed value and is not the standard deviation of participants’ results. The fixed value set for PCV is based on the existing regulation, the acceptance criteria indicated by the methods, the matrix, the concentration level of analyte

and/or on experience from previous studies. It is backed up by mathematical models such as Thompson Horwitz equation.⁶

4.6 z-Score

An example of z-score calculation using data from the present study is given in Appendix 2.

For each participant's result a z-score is calculated according to Equation 2 below:

$$z = \frac{(\chi - X)}{\sigma} \quad \text{Equation 2}$$

where:

- z is z-score;
- χ is a participant's result;
- X is the assigned value;
- σ is the target standard deviation.

A z-score with absolute value ($|z|$):

- $|z| \leq 2.0$ is satisfactory;
- $2.0 < |z| < 3.0$ is questionable;
- $|z| \geq 3.0$ is unsatisfactory.

To account for potential low bias in the consensus value due to inefficient methodologies, a number of scores were adjusted for a 'maximum acceptable concentration'. Results lower than the maximum acceptable concentration but with a z-score greater than 2.0 had their z-score adjusted to 2.0. Additional information is given in Section 6.4.

4.7 E_n-Score

An example of E_n-score calculation using data from the present study is given in Appendix 2.

The E_n-score is complementary to the z-score in assessment of laboratory performance.

E_n-score includes measurement uncertainty and is calculated according to Equation 3 below:

$$E_n = \frac{(\chi - X)}{\sqrt{U_\chi^2 + U_X^2}} \quad \text{Equation 3}$$

where:

- E_n is E_n-score;
- χ is a participant's result;
- X is the assigned value;
- U_χ is the expanded uncertainty of the participant's result;
- U_X is the expanded uncertainty of the assigned value.

An E_n-score with absolute value ($|E_n|$):

- $|E_n| \leq 1.0$ is satisfactory;
- $|E_n| > 1.0$ is unsatisfactory.

4.8 Traceability and Measurement Uncertainty

Laboratories accredited to ISO/IEC Standard 17025:2018⁷ must establish and demonstrate the traceability and measurement uncertainty associated with their test results. Guidelines for quantifying uncertainty in analytical measurement are described in the Eurachem/CITAC Guide.⁸

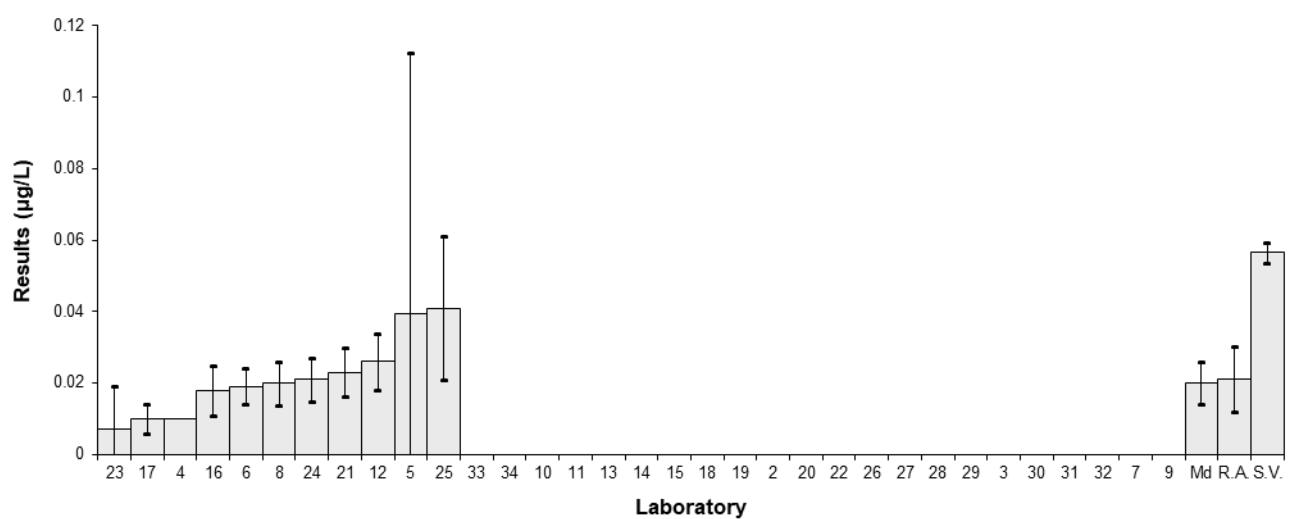

Figure 82

6 DISCUSSION OF RESULTS

6.1 Assigned Value

Assigned values for the tests in the study samples were the robust averages of participants' results. The robust averages and their associated expanded uncertainties were calculated using the procedures described in ISO 13528:2015(E). Results less than 50% or more than 150% of the robust average were removed before calculation of the assigned value.⁸ Appendix 2 sets out the calculation for the expanded uncertainty of the robust average of PFHxA in S1.

No assigned values were calculated for PFNS and PFDS in S1, PFNA in S3 and PFDS, PFUdS, PFDoS, PFTrDS, PFTrDA, PFTeDA and 11Cl-PF3OUDs in S4, because the reported results were either too few or too variable.

Traceability: The consensus of participants' results is not traceable to any external reference, so although expressed in SI units, metrological traceability has not been established.

Assigned values for spiked analytes in Samples S2 and S4 were within the range 49% to 91% of the spiked concentration for that analyte (Table 86).

Although a low spiked recovery was found for GenX and 11Cl-PF3OUDs in S2 an assigned value was still set for these analyte because there was reasonable consensus between reported results with between-laboratory CV's of 12% and 26 respectively (Table 87).

Table 86 Comparison of Assigned Value and Spiked Concentration.

Sample	Matrix	Analyte	Units	Spiked Concentration	Assigned Value	Assigned/ Spike (%)

*Robust Average.

6.2 Measurement Uncertainty Reported by Participants

Participants were asked to report an estimate of the expanded measurement uncertainty associated with their results. Of 1962 numerical results, 1908 were reported with an expanded measurement uncertainty, indicating that not all laboratories have addressed this requirement of ISO 17025.⁷ The participants used a wide variety of procedures to estimate expanded measurement uncertainty. These are presented in Table 2. A number of participants reported using NATA GAG Estimating and Reporting MU as their guide; this document is now obsolete and removed from NATA website.

Proficiency tests allow a check of participants' uncertainty estimates. Results and the expanded MU are presented in the bar charts for each analyte (Figure 2 to 82). In this study, the magnitude of the reported expanded uncertainties was within the range 0% to 727% of the reported value. 109 were less than 10% relative, which the study coordinator believes is unrealistically small for a routine PFAS measurement, and 88 were larger than 50% relative.

Results returning a satisfactory z-score but an unsatisfactory E_n -score may have underestimated the uncertainty.

Some participants attached an estimate of the expanded measurement uncertainty to a result reported as less than their limit of reporting. An estimate of uncertainty expressed as a numerical value cannot be attached to a result expressed as a range.⁸

In some cases results were reported with an inappropriate number of significant figures. The recommended format is to write uncertainty to no more than two significant figures and then to write the result with the corresponding number of decimal places (for example a results of "12.808 ± 2.818 µg/L", should instead be expressed as "12.8 ± 2.8 µg/L").⁸

6.3 E_n -Score

E_n -score should be interpreted only in conjunction with z-scores. The E_n -score indicates how closely a result agrees with the assigned value taking into account the respective uncertainties. An unsatisfactory E_n score for an analyte can either be caused by an inappropriate measurement, an inappropriate estimation of measurement uncertainty, or both.

The dispersal of participants' E_n -scores is graphically presented in Figure 83. Where a laboratory did not report an expanded uncertainty with a result, an expanded uncertainty of zero (0) was used to calculate the E_n -score.

Of 1818 results for which E_n -scores were calculated, 1461 (80%) returned a satisfactory score of $|E_n| \leq 1.0$ indicating agreement of the participants' results with the assigned values within their respective expanded measurement uncertainties.

6.4 z-Score

A target standard deviation equivalent to 20% coefficient of variation (CV) was used to calculate z-scores. The between-laboratory coefficient of variation predicted by the modified Horwitz equation⁶ and the between-laboratories CV are presented for comparison in Table 87.

To account for possible bias in the consensus values due to laboratories using inefficient analytical/extraction techniques, z-scores were adjusted for PFOSA in Sample S4. Where the assigned value is less than 80% of the spiked value, a maximum acceptable concentration is set to two target standard deviations more than the spiked level and z-scores greater than 2 are adjusted to a value of 2. When the results are higher than the maximum acceptable concentration, z-scores are not adjusted. This approach ensures that laboratories reporting

results close to the spiked concentration were not penalised. z-Scores of less than 2 were left unaltered.

The dispersal of participants' z-scores is graphically presented by laboratory in Figures 84 and 86 and by analyte in Figures 85 and 87.

Of the 1818 results for which z-scores were calculated, 1654 (91%) returned a satisfactory z-score of $|z| \leq 2.0$ and 64 (4%) were questionable with a z-score of $2.0 < |z| < 3.0$. Participants with multiple z-scores larger than 2.0 or smaller than -2.0 should check for laboratory bias.

6.6 Summary of Participants' Results and Performances

Summaries of participants' results and performances for scored analytes in this PT study are presented in Tables 88 to 91, and Figures 84 to 87.

Five laboratories reported at least one PFAS analyte that was not spiked into the test samples S2 and S4 by the study coordinator. These results are presented in Appendix 3.

Thirty-one laboratories analysed both matrices. Laboratory 25 returned satisfactory z-scores for all analytes for which z-scores were calculated (71) while laboratory 12 returned satisfactory z-scores for 70 out of a total of 71. All results reported by laboratories 8 (68), 24 (67), 3 (65), 27 (64), 15 (52), 11 (27) and 33 (4) returned satisfactory z-scores.

Of the laboratories that analysed both matrices (soil and water), Laboratory 25 had the highest number of satisfactory E_n-scores (71 out of 71). Laboratories 15, 27 and 33 returned satisfactory E_n-scores for all analytes reported.

Two participants analysed the water matrix only. Of the total number of results for which z-scores were calculated (34), laboratory 23 reported 32. Thirty-one of these returned satisfactory z-scores and 22 returned satisfactory E_n scores.

Most unsatisfactory results reported by laboratory 5 in soil samples S1 and S2 were either lower or higher than the assigned value by a factor of 5 or 2. Systematic bias was also observed in the results of laboratory 22, most of the unsatisfactory results they reported in samples S3 and S4 were higher than the assigned value by a factor of 2. These laboratories should check their dilution and/or standard preparation procedure. Their results were not included in the analyses of extraction methods and of instrumental techniques employed by participants.

Laboratory 7 should check for method bias as most of the results they reported in S1 and S2 were higher than the assigned value. Laboratories 32 and 34 should also check for laboratory/method bias, as the unsatisfactory results they reported were consistently higher than the assigned value.

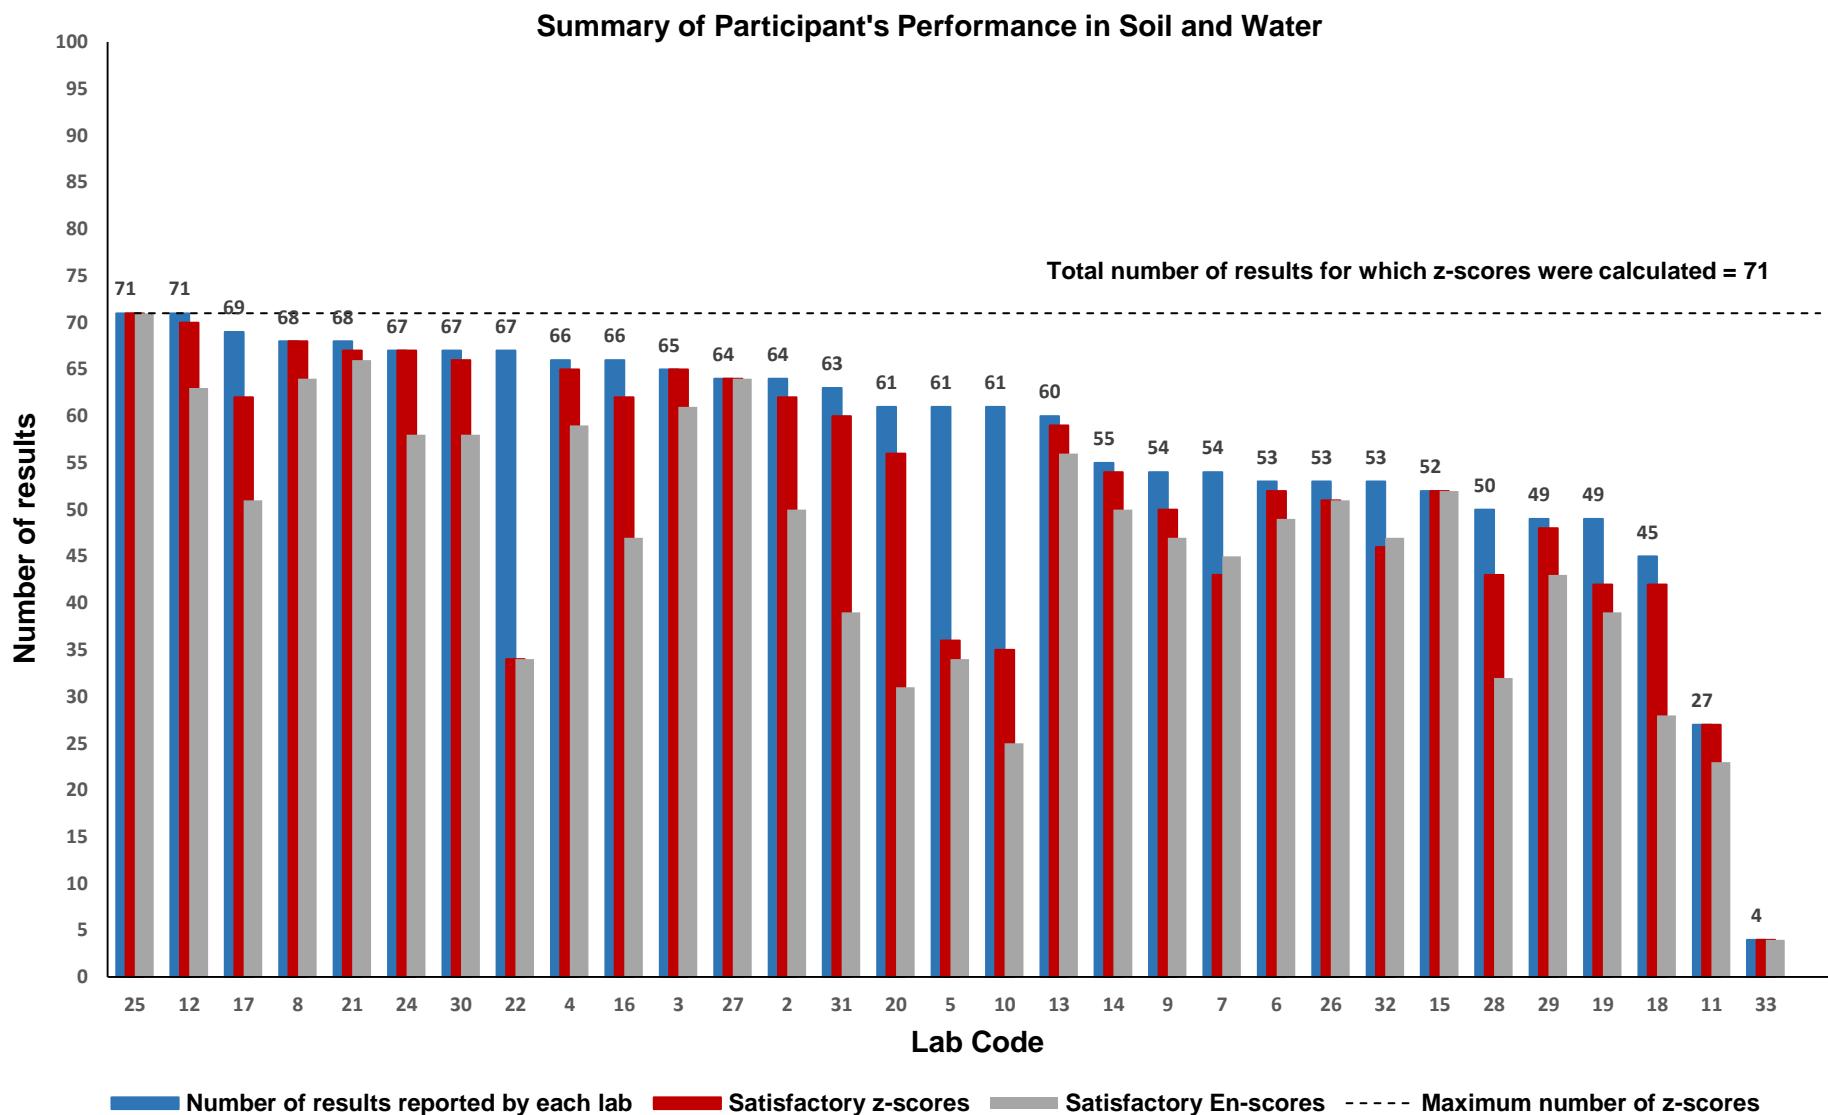

Figure 89 Summary of Participants' Performance in Soil and Water

6.7 Participants' Results and Analytical Methods for PFAS in Soil

Participants were requested to analyse the samples using their normal test method and to report a single result as they would normally report to a client. The method descriptions provided by participants for PFAS measurements in soil are presented in Appendix 5.

Participants performance in the two study samples were comparable, with similar between laboratory coefficients of variation.

Extraction

Sample S1 was contaminated soil, whereas Sample S2 was soil fortified for 22 individual PFAS components. Analytes' mass fraction in the two soil samples were between 1.20 µg/kg and 42.1 µg/kg (with PFOS in S1 at 484 µg/kg).

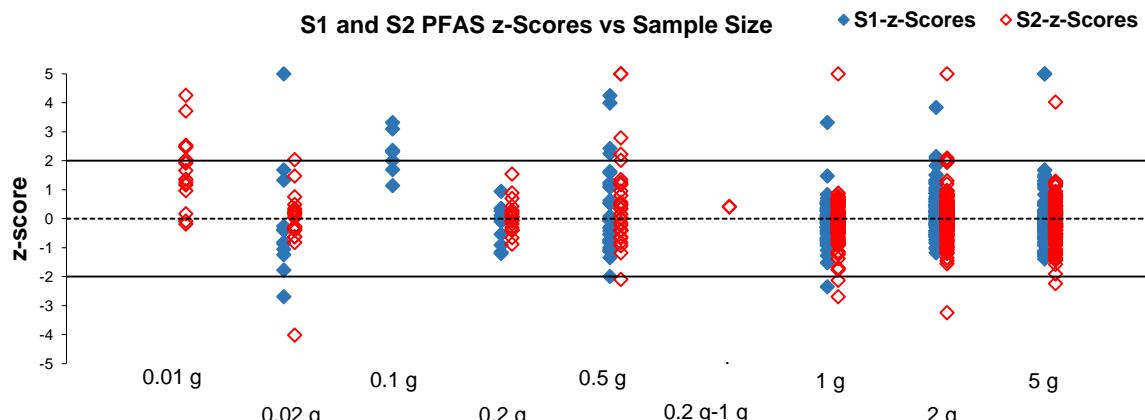

Of 30 participants who reported results for both soil samples, 28 used the same sample size for extraction. Laboratories used a wide variety of sample sizes. Plots of participants' performance in S1 and S2 versus the amount of sample taken for analysis are presented in Figure 90. Results from a sample size of 0.01 g to 0.1 g were biased low or high. Caution should be exercised when a small sample size is taken for analysis as this might not be representative of the whole sample.

Most laboratories extracted their samples for 30-60 minutes. One laboratory conducted their sample extraction over 960 min (Figure 91). Laboratory 7 reported: "Methanol extract blown to near dryness then resuspended in water before SPE." All but two results reported by Laboratory 7 in S1 and S2 were higher than the assigned value.

Methanol, base modified methanol and acetonitrile were the preferred extraction reagents. In general, PFAS results were compatible with each other regardless of the extraction reagent used (Figure 92).

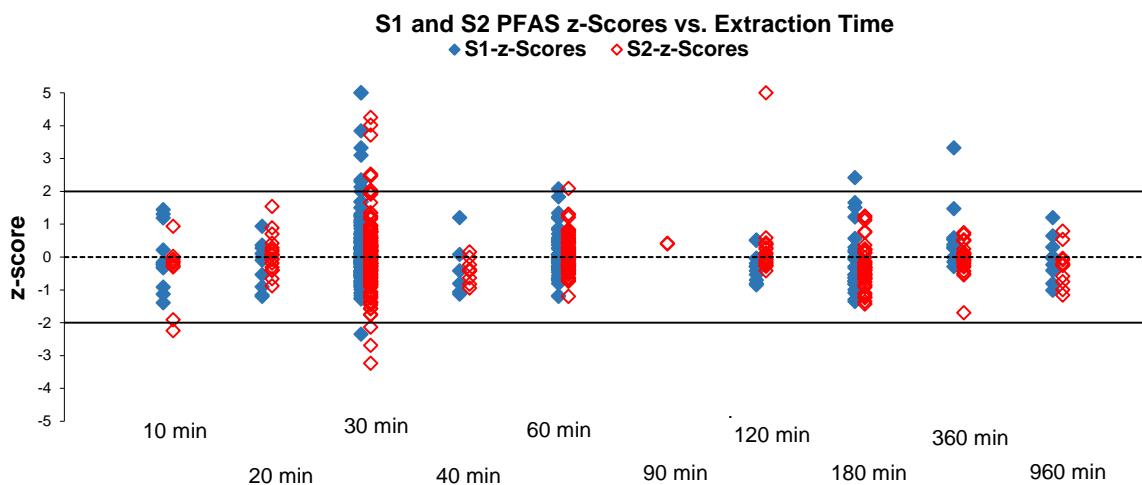

Participants used a wide variety of extraction procedures based on LSE, alkaline digestion, QuEChERS or accelerated solvent extraction. The use of mass labelled standards played a significant role in correcting the difference between these in-house analytical methods. Most results produced were compatible with each other (Figure 93).

The most popular method was a LSE extraction based on the method developed by Powley et al. This method involved a sample size of 2 g, methanol or methanol base as extraction solvent, two to three rounds of 30 min shaking at room temperature and a clean-up step using active carbon. This method is known to give a recovery of 75% to 120% for all chain lengths.⁹

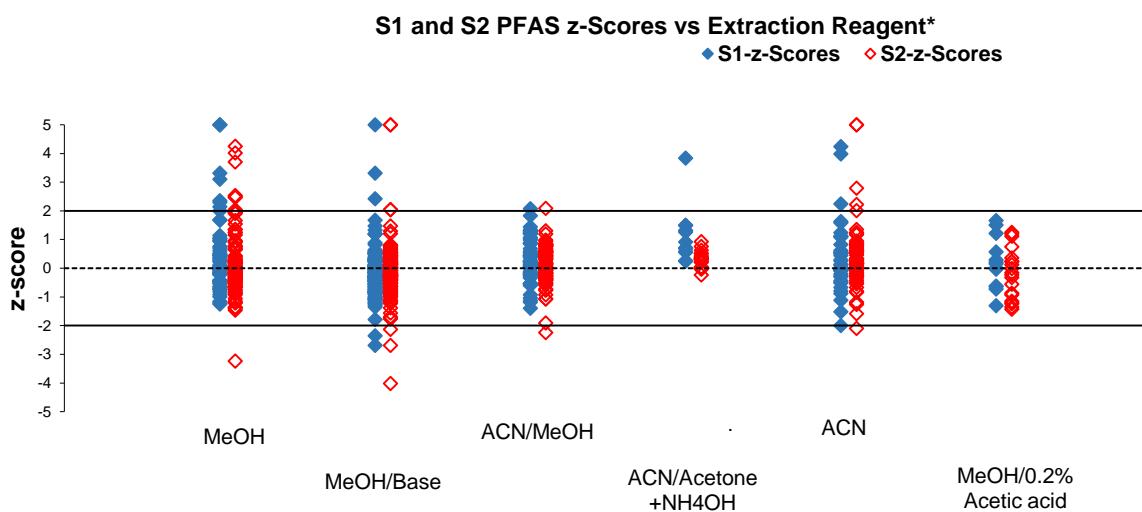

Scores greater than 5 have been plotted as 5.

Figure 90 Participants' Performance in S1 and S2 vs Sample Size

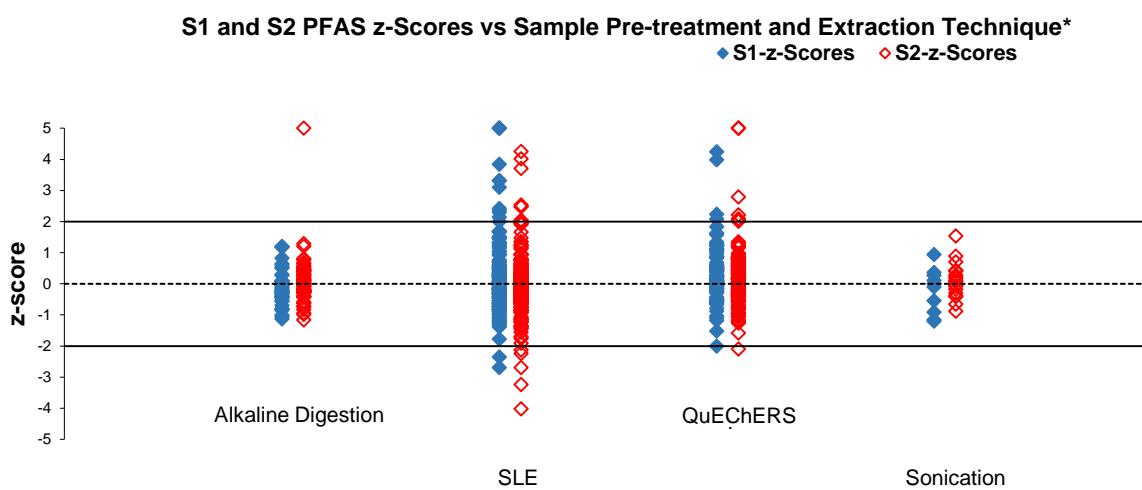

Scores greater than 5 have been plotted as 5.

*Results from laboratory 5 were excluded. Scores greater than 5 have been plotted as 5.

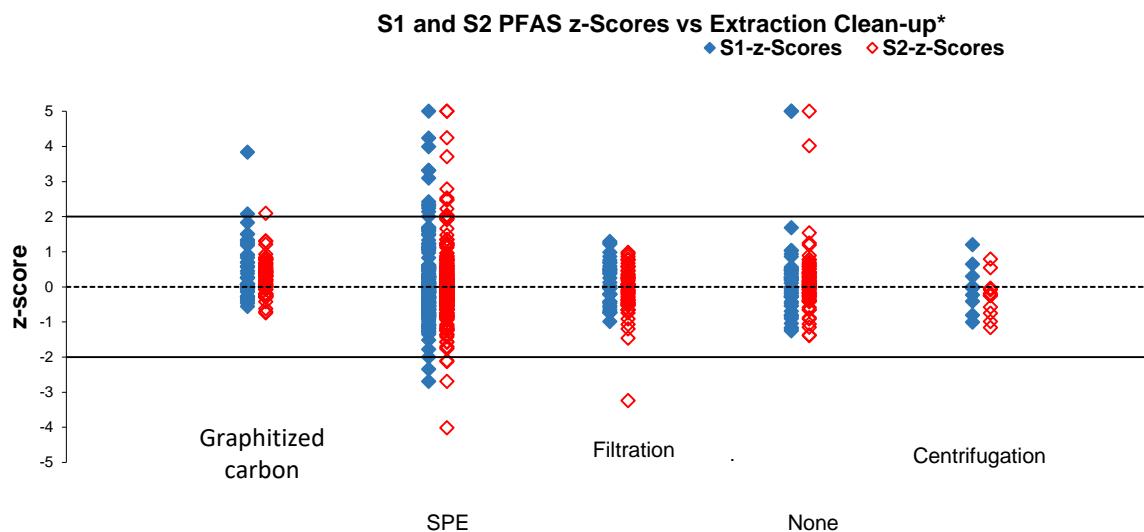

Figure 92 Participants' Performance in S1 and S2 vs. Extraction Reagent

*Results from laboratory 5 were excluded. Scores greater than 5 have been plotted as 5.

Figure 93 Participants' Performance in S1 and S2 vs Extraction Technique

Clean-up of the crude extracts is an important step in the removal of matrix constituents that may interfere in instrumental determination. Matrix effects have been known to be one of the main causes of variability in results. Most participants used SPE. Three laboratories used filtration to remove solids from the extract, and 4 did not clean up after extraction. There was no correlation evident between participants' reported results for PFAS and the clean-up procedure used (Figure 94).

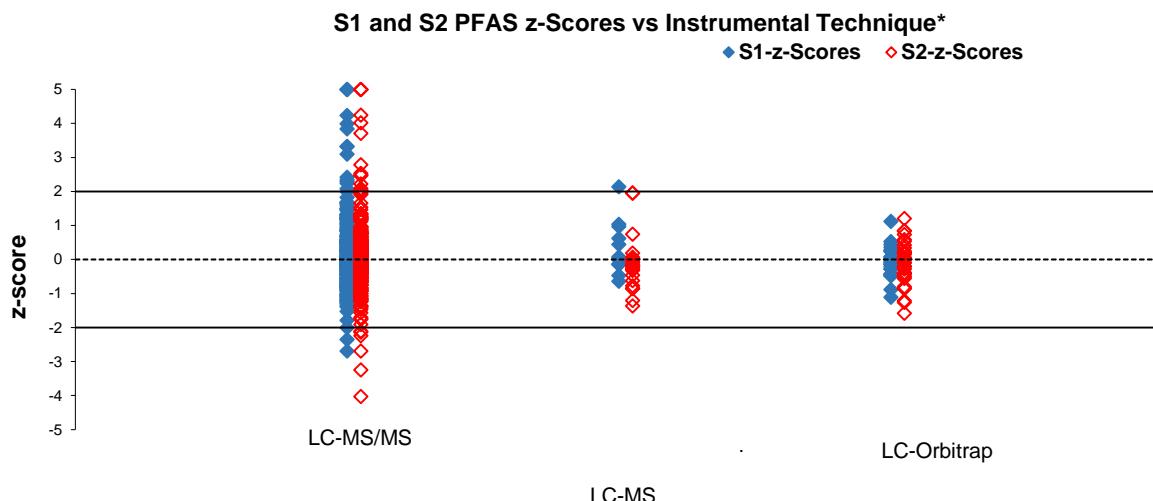

*Results from laboratory 5 were excluded. Scores greater than 5 have been plotted as 5.

Figure 94 Participants' Performance in S1 and S2 vs Extraction Clean-up Procedure

Instrumental Technique

The analytical detection method of choice was LC-MS (Figure 95). With the exception of three, all participants reported using LC-MS/MS (QQQ) for PFAS measurements. Laboratories 15 and 30 used Orbitrap and laboratory 4 used LC-MS with UHPLC guard column. Most LC-MS/MS users used a C18 based column. All but three participants reported using a delay column.

Eleven laboratories reported diluting both samples before analysis while 2 diluted only sample S1 for PFOS quantification alone.

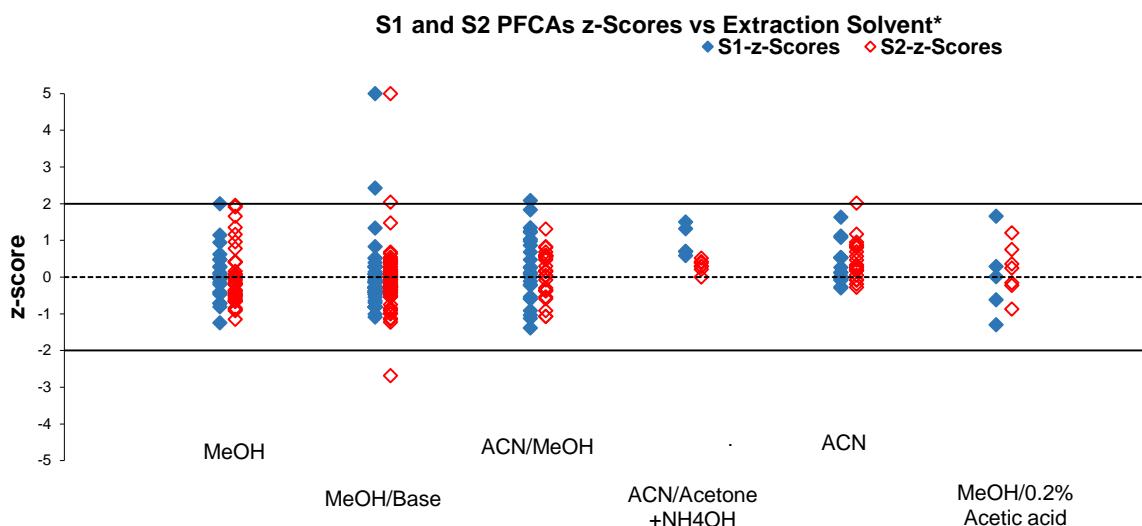

*Results from laboratory 5 were excluded. Scores greater than 5 have been plotted as 5.

Figure 95 Participants' Performance in S1 and S2 vs Instrumental Technique

6.7.1 Individual PFCA Analytes in Soil

Results reported by participants for PFCAs in S1 and S2 were generally compatible with each other. The between laboratory coefficient of variation was between 11% and 16% for PFCAs results reported in S1, and between 7.8% and 15% for PFCAs results reported in the spiked soil sample S2. PFBA in S1 followed by PFOA in S1 and PFBA in S2 were the analytes with the largest coefficients of variation, of 16% and 15% respectively.

*Results from laboratory 5 were excluded. Scores greater than 5 have been plotted as 5.

Figure 96 Participants' Performance in S1 and S2 vs Extraction Reagent

Figure 96 presents plots of participants' z-scores for PFCAs in S1 and S2 versus the extraction solvent used. Although there may be a discrepancy between results produced by extraction solvents containing methanol and those produced by other extraction solvents, the limited number of results has hampered our attempt to identify any relationship between them.

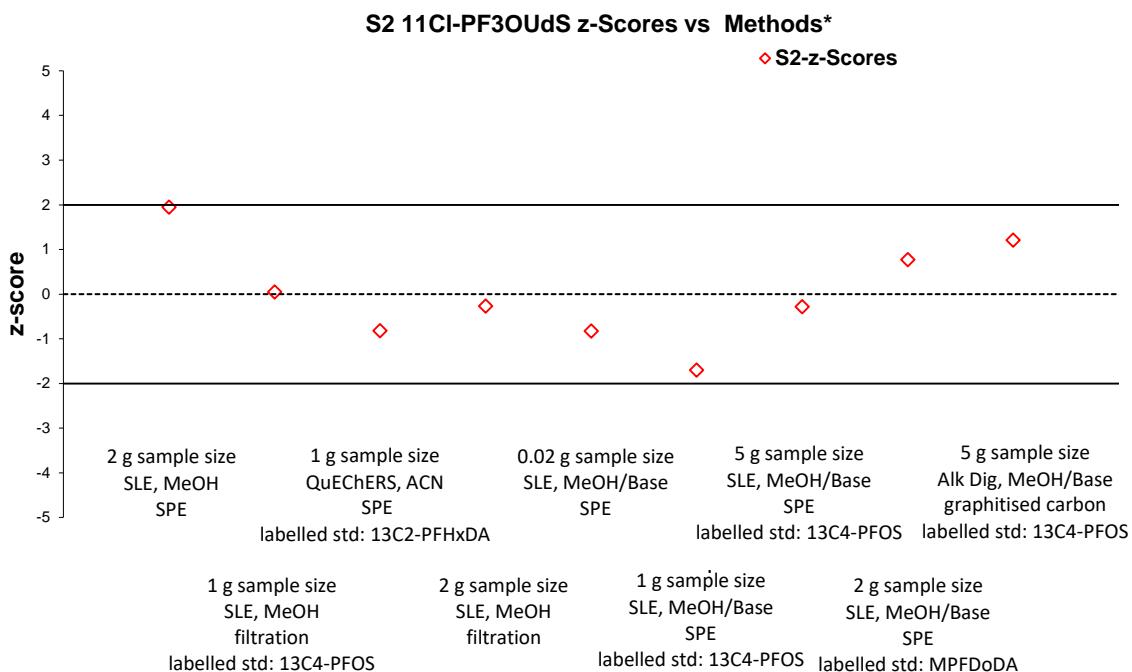

6.7.2 Individual PFECA and PFESA Analytes in Soil

GenX and ADONA and were introduced in a PT study for the first time in 2019 and 2020 respectively. Approximately one third of participants reported results for ADONA and GenX in S2 and most of them performed well; the between laboratory CV for these tests was 22% and 12% respectively.

The same standard solution was used to spike GenX in S2 as for S4. While the results reported for GenX in S2 were low at 49% of the spiked value the results reported for S4 were 91% of the spiked value. Low recovery in S2 may be explained by loses during PT sample preparation or low extraction efficiency due to the high organic content of the soil material used.

9Cl-PF3ONS and 11Cl-PF3OUdS Of 28 participants who reported results in the soil samples, 9 reported results for 9Cl-PF3ONS and 11Cl-PF3OUdS and all performed satisfactorily.

This was the first time that **11Cl-PF3OUdS** has been included in a PT study. Although the spiked recovery for this test was low (58%), an assigned value was still set because there was reasonable consensus between reported results - the between-laboratory CV was 26%. Plots of participants' performance for 11Cl-PF3OUdS in S2 versus method used are presented in Figure 97.

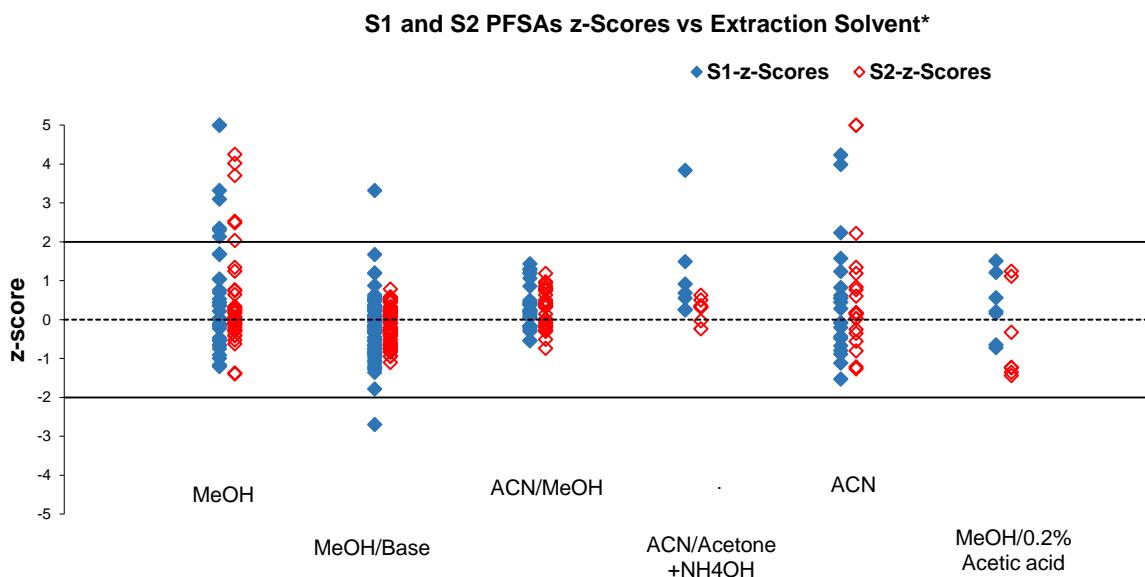

*Laboratory 5 excluded. Labelled standards added before extraction.

Figure 97 S2 11Cl-PF3OUdS z-Scores vs. Methods

6.7.3 Individual PFSA Analytes in Soil

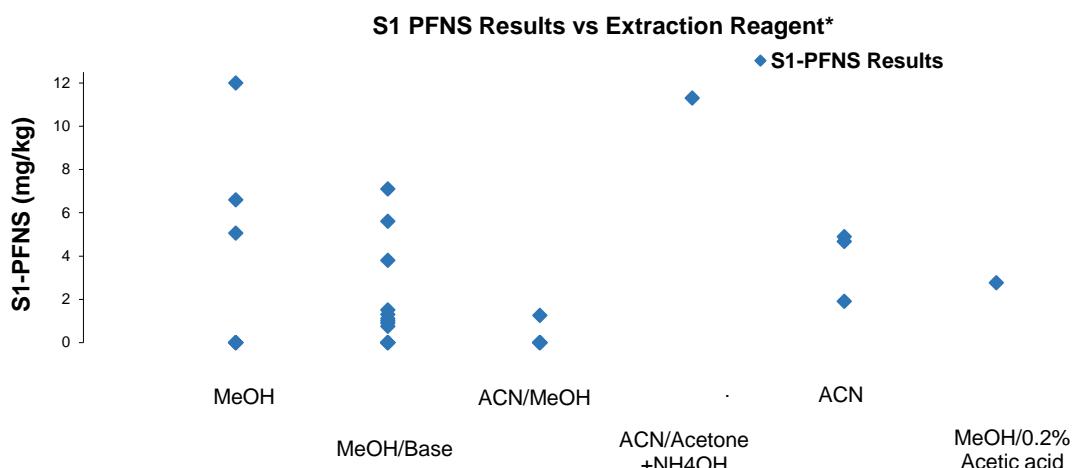

Plots of participants' z-scores for PFAs in S1 and S2 versus the extraction solvent used are presented in Figure 98. No relationship was evident between results from extraction solvents containing methanol and those produced by the other extraction solvents

*Results from laboratory 5 were excluded. Scores greater than 5 have been plotted as 5.

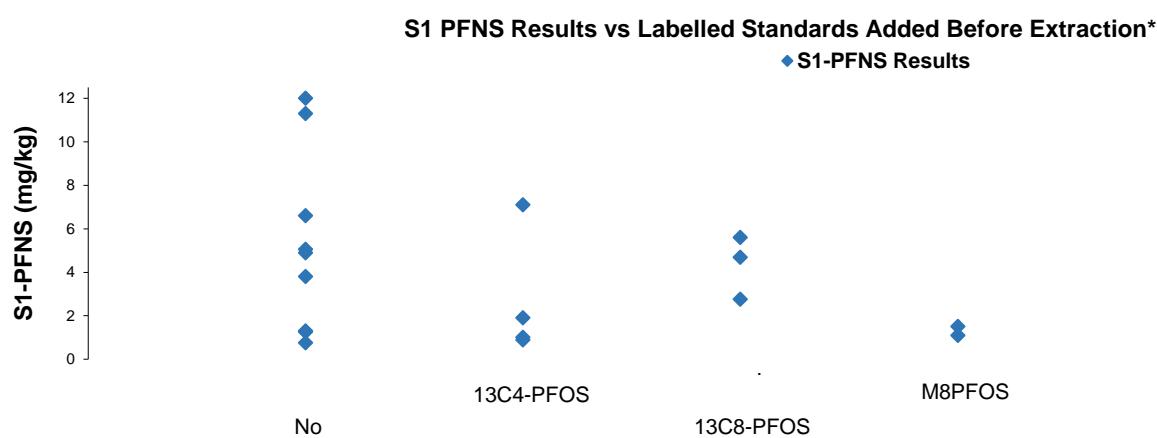

Figure 98 Participants' Performance in S1 and S2 vs Extraction Reagent

PFNS and PFDS No assigned value could be set for PFNS and PFDS in S1 because the results reported for these analytes were not compatible. Plots of participants results and the extraction reagent used or the labelled standards added before and after extraction are presented in Figures 99 to 104. No correlation was evident.

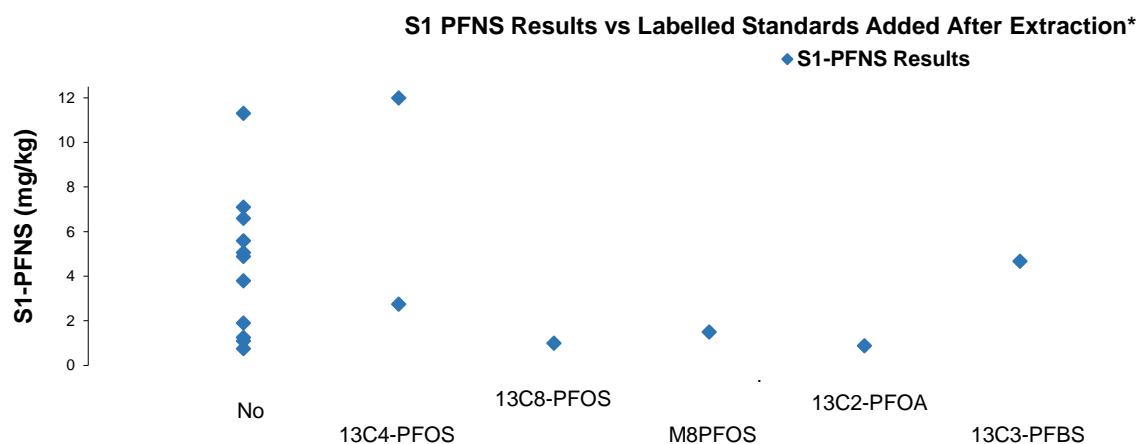

*Results from laboratory 5 were excluded.

Figure 103 S1 PFDS Results vs Labelled Standards Added Before Extraction

*Results from laboratory 5 were excluded.

Figure 104 S1 PFNS Results vs Labelled Standards Added After Extraction

PFHxS and PFHxS_L and PFOS and PFOS_L For PFAS that contain linear and branched isomers, participants were asked to report total, the sum of linear and branched and for PFOS and PFHxS to report both total (the sum of linear and branched isomers) and linear (the linear isomers only) results.

In the present study, both samples were only spiked with linear PFHxS and linear PFOS standards, and therefore the linear to total ratio was expected to be 100% for both samples.

22 participants reported results for both PFHxS total and linear in S2. The linear to total ratio of the results reported PFHxS isomers was between 72% to 102% (Figure 105). Calculation errors may explain some of the results reported for PFHxS total and linear that did not return a ratio of 100%.

Figure 106 presents bar charts with ratios of PFOS_L results vs PFOS total results as reported by participants who reported results for both tests (25). These ratios were between 78% to 120%. The results reported by Laboratories 5 and 7 for PFOS total and linear in S2 were higher than the assigned value by the same factor of 100 and 2 respectively.

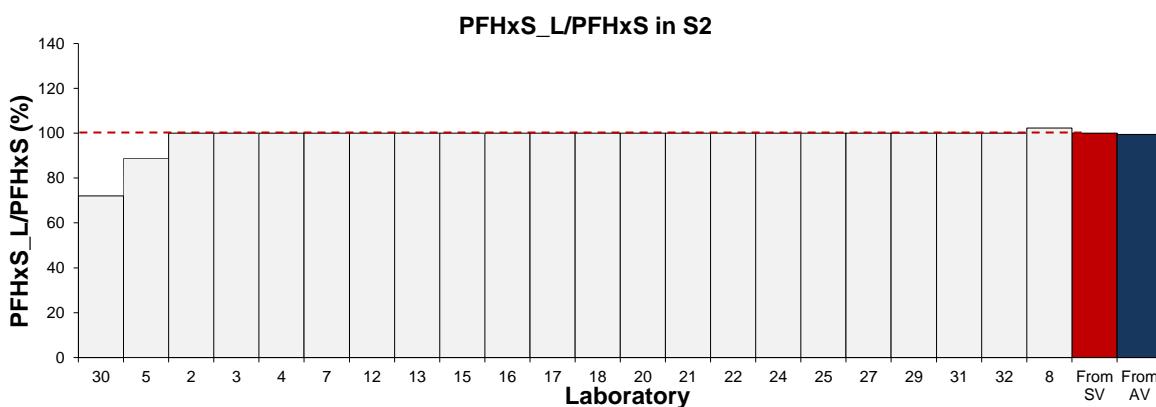

Figure 105 Bar Charts of PFHxS_L/PFHxS

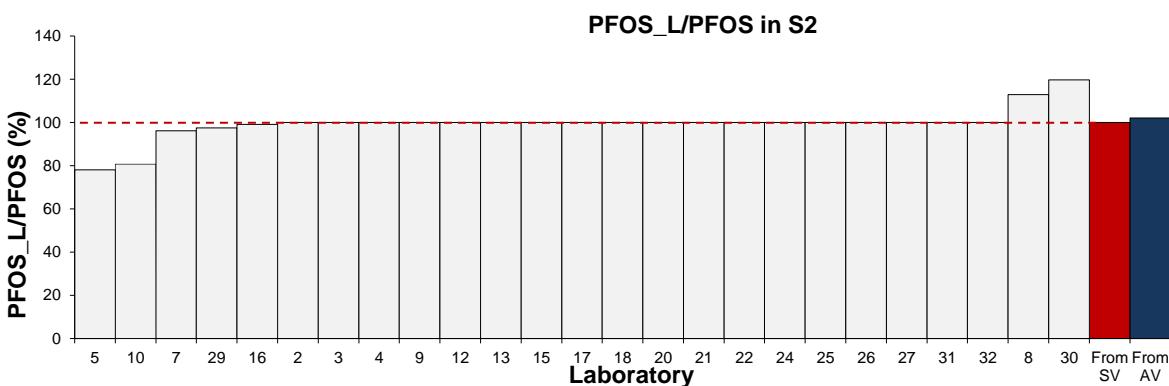

Figure 106 Bar of Charts PFOS_L/PFOS

6.7.4 Individual PFAA Precursors Analytes in Soil

PFOSA level in S1 was 1.7 µg/kg and in S2 was 4.14 µg/kg. Of 31 participants who reported results for the soil samples S1 and S2, 22 reported results for PFOSA in S1 and 25 in S2. All performed satisfactorily, with the exception of one laboratory in S1 and two in S2 (laboratory 5 was not considered).

N-EtFOSA, N-MeFOSA, N-MeFOSE and 8:2 FTS in S2 did not present analytical difficulty to participating laboratories. The between laboratory CVs for these analytes were between 7.7% and 16%.

6.8 Participants' Results and Analytical Methods for PFAS in Water

The method descriptions provided by participants for PFAS measurements in water are presented in Appendix 6.

Extraction

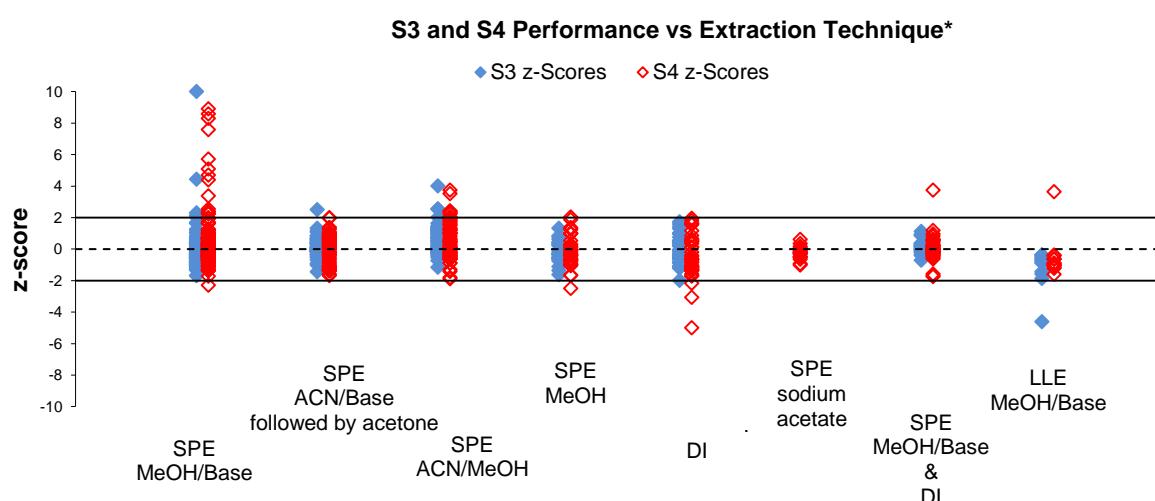

Sample S3 was contaminated water, whereas sample S4 was autoclaved tap water fortified for 26 individual PFAS components. Analyte concentration in S3 was between 0.0096 µg/L and 3.79 µg/L, while concentration in S4 was between 0.00437 and 0.096 µg/L. Of 31 participants who reported results for both water samples, 28 used the same sample size for extraction.

In order to avoid analyte absorption into the wall of the container, participants were instructed to use the entire contents of the bottle for analysis. 20 followed this instruction with the remaining participants taking only a sub-sample. Laboratory 24 reported using 100 mL of the sample; they may have sampled from both containers provided. Laboratories 2 and 4 reported using both 50 mL (or the entire container) and 10 mL samples. Some of the results they reported may have been produced from analyses conducted on the 50 mL sample and others from the 10 mL sample.

Most laboratories chose to enrich the test samples using SPE. Three laboratories reported using direct injection without sample enrichment (Figure 107). Laboratory 24 used SPE extraction only for sample S4. Laboratories 25 and 27 conducted SPE extraction for some analytes and for some only direct injection. Laboratory 20 reported using LLE as extraction technique for the two water samples, but they also reported using base modified methanol as elution solvent.

Base modified methanol was the preferred elution reagent. There was no correlation evident between participants' reported results for PFAS and the solvent used (Figure 107).

The most popular method used for measurements of PFAS water samples S3 and S4 was a SPE extraction procedure which involved a sample size of 50 mL, methanol or methanol base as elution solvent, and no clean-up step.

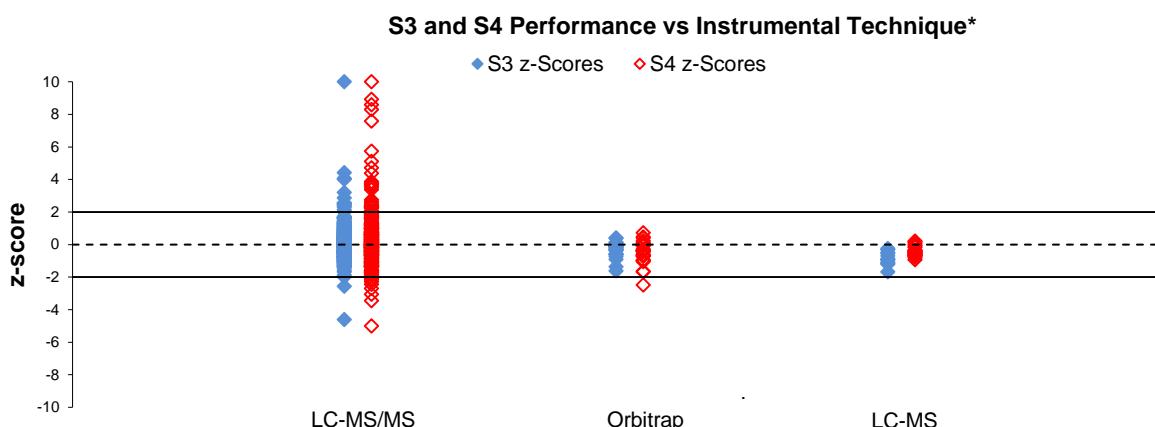

*Laboratory 22 excluded. Scores greater than 10 have been plotted as 10.

Figure 107 S3 and S4 Performance vs Extraction Technique

Instrumental Technique

With the exception of 3 participants, all laboratories reported using LC-MS/MS(QQQ) for PFAS measurements. Laboratories 15 and 30 used Orbitrap while laboratory 16 reported using LC-MS (Figure 108). Most LC-MS/MS users used a C18-based column and all but 3 reported using a delay column.

*Laboratory 22 excluded. Scores greater than 10 have been plotted as 10.

Figure 108 S3 and S4 Performance vs Instrumental Technique

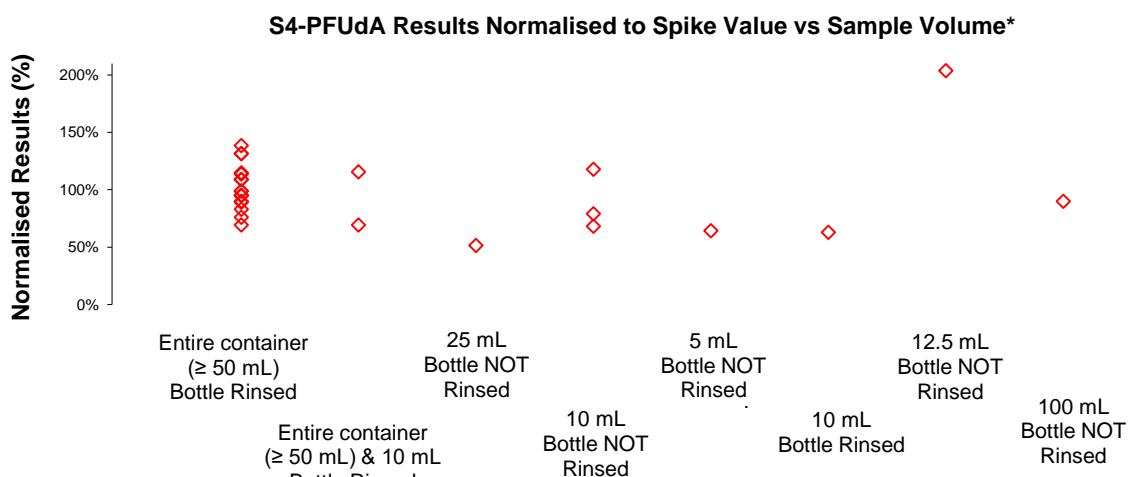

6.8.1 Individual PFCAs Analytes in Water

Measurements of some PFCAs in S3 and S4 challenged participants' techniques. The between laboratory coefficient of variation was between 13% and 27% for PFCAs results reported in S3, and between 11% and 55% for PFCAs results reported in S4.

PFNA No assigned value was set for PFNA in S3 because the reported results were not compatible they were approximately 40% more variable than in S4. The level of PFOS in S3 was 3.79 µg/L and in S4 was 0.0138µg/L. Matrix effects from the high level PFOS in S3 may explain this discrepancy.

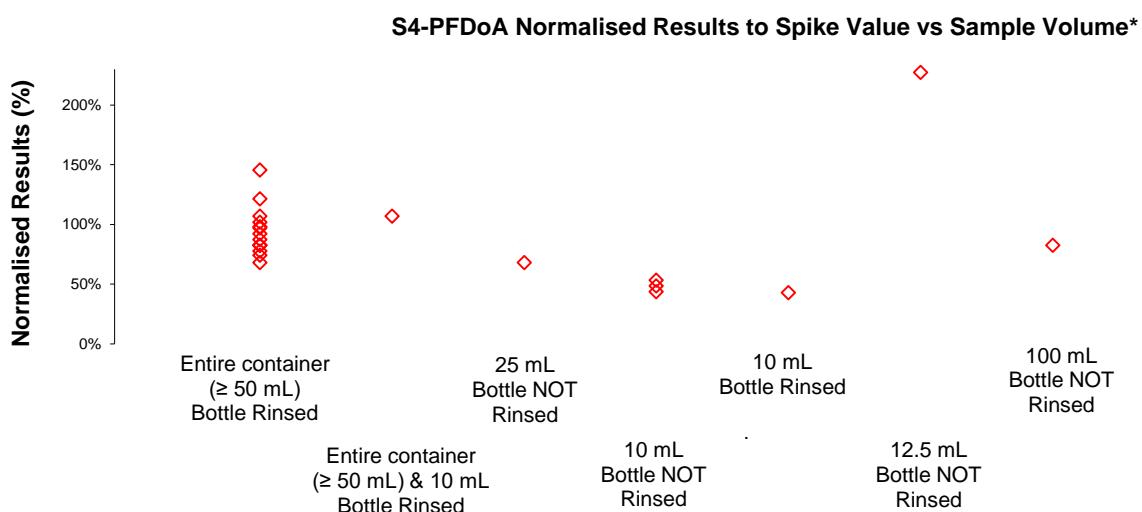

PFUdA, PFDoA, PFTrDA and PFTeDA were identified from literature as well as previous experience as analytes which are at risk of being absorbed into the wall of the container during sample preparation and/or during analysis.¹⁰⁻¹⁴ These long chain PFCAs were spiked directly into each bottle with the aim of minimising loss during preparation. The assigned values for these analytes were between 76% and 95% of the spiked value.

Plots of participants' results (normalised to spike value) versus testing method are presented in Figures 109 to 112. Most participants who used the entire or almost entire content of the container (50 mL or more) for analysis were able to recover more than 69% of the spiked PFUdA and PFDoA in water.

S4 11Cl-PF3OUdS Results vs Methods*

*Labelled standards added before extraction

Figure 113 S4 11Cl-PF3OUdS Results vs. Methods

No assigned value could be set for PFTrDA and PFTeDA in S4 because the results were not compatible with each other, with between laboratory CVs of 55% and 53% respectively. Absorption into the surface of the sample container wall during analysis may explain these variations.

There is a correlation between those participants who used the entire or almost entire sample container for analysis, and those who had high recoveries of PFTrDA from the spiked water sample (Figures 112).

6.8.2 Individual PFECA and PFESA Analytes in Water

A limited number of participants provided results for PFECA and PFESA analytes in water. Approximately half reported results for ADONA and GenX and one third for 9Cl-PF3ONS and 11Cl-PF3ONS. Most of these laboratories performed satisfactorily.

11Cl-PF3OUDs The results reported for 11Cl-PF3OUDs in S4 were variable (CV of 58%) and hence no assigned value could be set. This was the first time that 11Cl-PF3OUDs in water was included in a PT.

Plots of participants results for 11Cl-PF3OUDs in S4 versus method used are presented in Figure 113

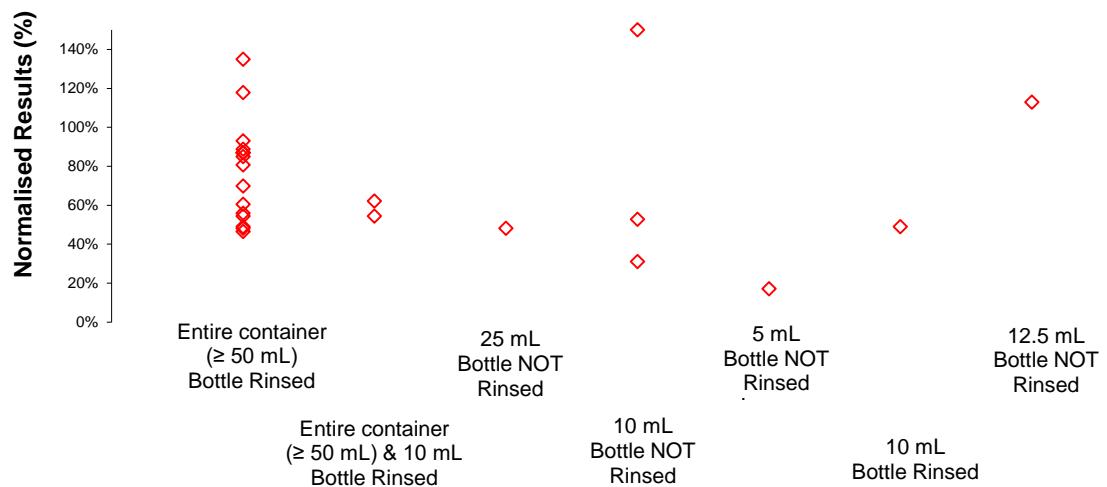

6.8.3 Individual PFSA Analyte in Water Commentary

PFDS robust average in S4 was 73% of the spiked value, however no assigned value could be set because the results reported for this analyte were not compatible.

Figure 114 shows the normalised PFDS results (against the spiked concentration) versus the amount of sample taken for analysis for each sample. Most of the normalised results greater than 60% were from participants who reported using the entire container (50 mL or more) and rinsing it.

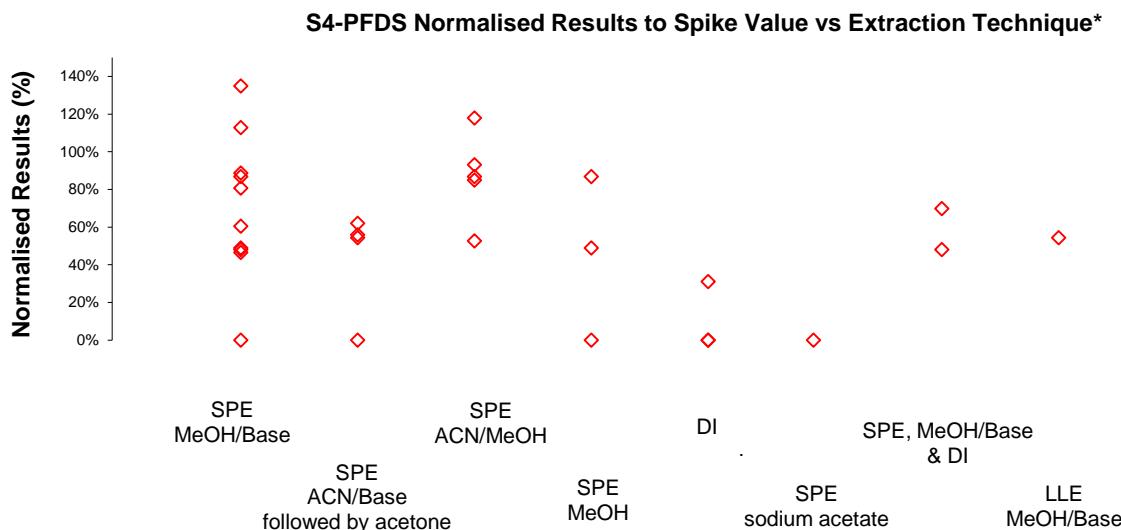

Plots of participants' results versus extraction technique used are presented in Figure 115. Due to the limited amount of data and the variety of analytical methods used, no significant trends in extraction and sample preparation were identified.

S4-PFDS Normalised Results to Spike Value vs Sample Volume*

*Laboratory 22 excluded. Laboratory 10's normalised result of 183% has been plotted as 150%

Figure 114 S4-PFDS Results Normalised to Spiked Value versus Sample Volume

*Laboratory 22 excluded. Laboratory 10's normalised result of 183% has been plotted as 150%

Figure 115 S4-PFDS Results Normalised to Spiked Value versus Extraction Technique

PFHxS and PFHxS_L and PFOS and PFOS_L As for the soil samples, for PFOS and PFHxS participants were asked to report both total (the sum of linear and branched isomers) and linear (the linear isomer only) results.

Twenty-three participants reported results for both total and linear PFHxS in S3. The ratios of PFHxS_L versus total PFHxS in S3 were between 65% and 100% while the assigned value ratio between the two isomers was 83% (Figure 116).

The water sample S4 was only spiked with the linear PFHxS standard, and therefore the linear to total ratio was expected to be 100%. 22 participants reported results for both PFHxS total and linear in S4. All reported results for both isomers were similar with the exception of two (Figure 117).

Twenty-five laboratories reported results for the two PFOS isomers in S3. The robust average of these results (outliers excluded) was 3.79 µg/L for total PFOS and 1.63 µg/L for linear PFOS, with the ratio of PFOS_L versus total PFOS being 43%. Figure 118 presents bar charts of PFOS_L results vs total PFOS results as reported by participants

As for PFHxS in S4 the expected ratio of PFOS_L versus total PFOS in S4 was also 100% as only PFOS_L was spiked into the water sample. The linear to total ratio of the results reported for PFOS isomers was between 67% to 100% (Figure 119).

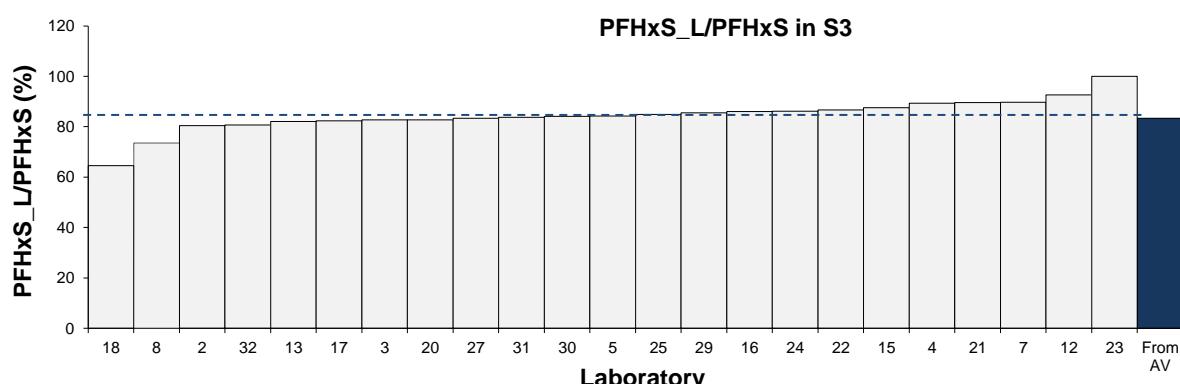

Figure 116 Bar Charts of PFHxS_L/PFHxS in S3

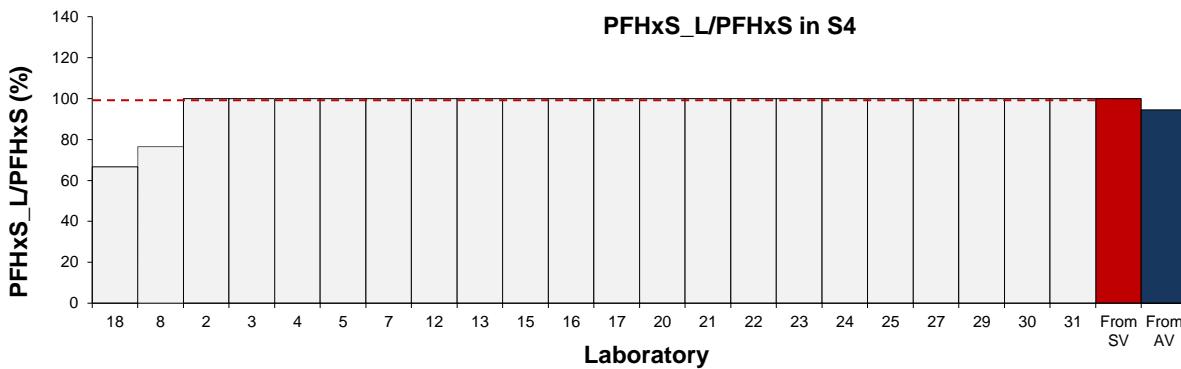

Figure 117 Bar Charts of PFHxS_L/PFHxS in S4

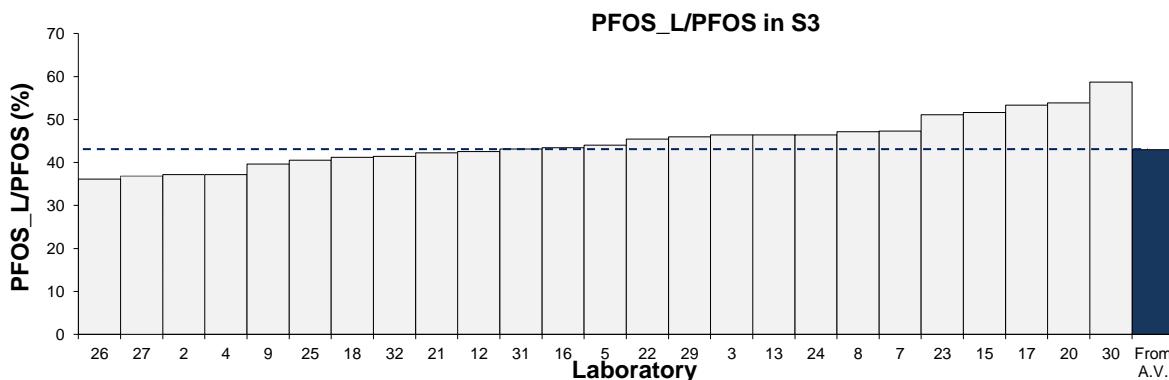

Figure 118 Bar Charts of PFOS_L/PFOS in S3

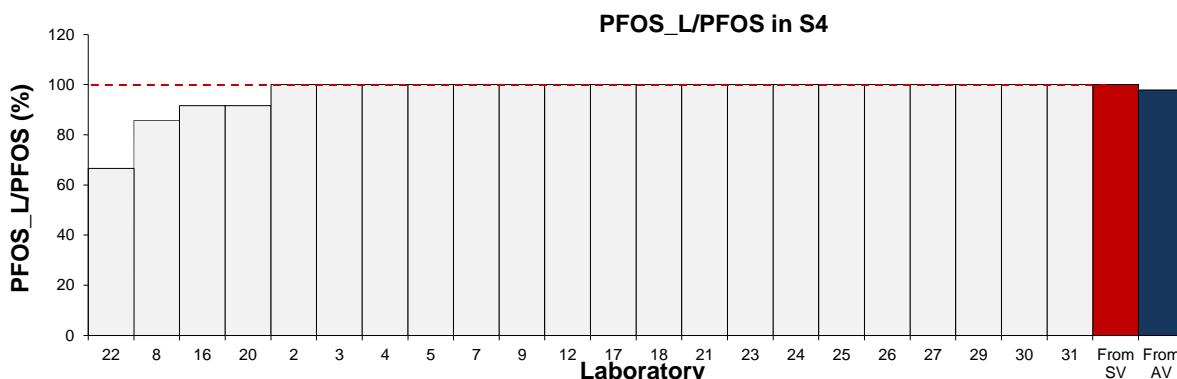

Figure 119 Bar Charts of PFOS_L/PFOS in S4

PFUdS, PFDoS and PFTrDS were spiked directly into each bottle with the aim of minimising the loss of these analytes during preparation. This was the first time that the long chain PFSAs, PFUdS, PFDoS and PFTrDS have been included in a PT study. No assigned value could be set for these tests because only a small number of participants reported results.

Only two laboratories (6 and 29), reported results for PFUdS and PFTrDS in S4. These results were in relatively good agreement with each other but at only between 33% and 55% of the spike value respectively. Four laboratories reported results for PFDoS in S4. Plots of normalised results to spike value versus method used are presented in Figure 120.

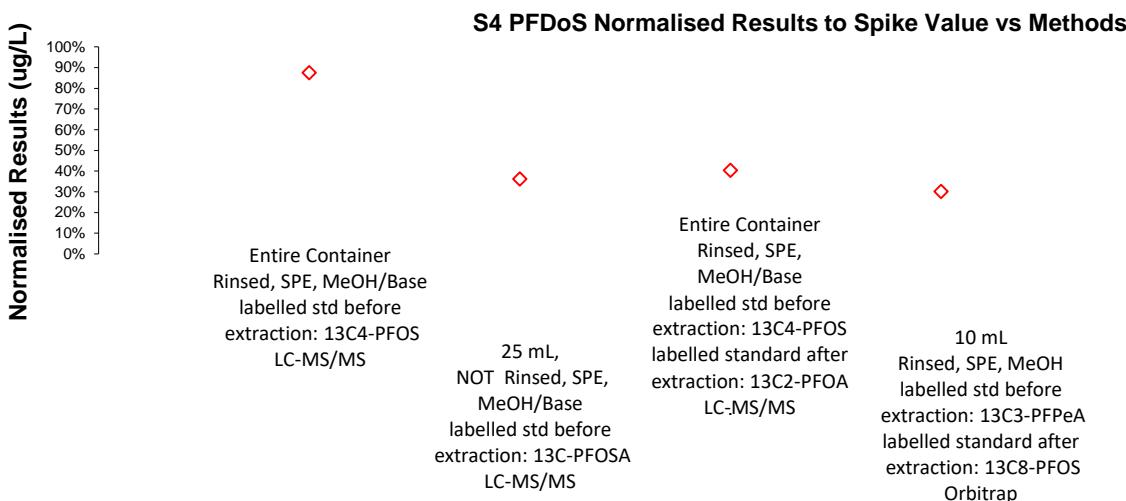

Figure 120 PFDoS Normalised Results to Spike Value vs Methods

6.8.4 Individual PFAA Precursors Analytes in Water

PFOSA As for long chain PFCAs and PFSAs, PFOSA was also identified as being an analyte which may potentially absorb into the container wall during sample preparation.^{12,15} This analyte was added directly into the final bottles rather than during bulk sample preparation in order to mitigate loss during preparation. The assigned value for PFOSA in S4 was 72% of the spiked value and the reported results were in relatively good agreement with each other with a between laboratory CV of 18% in S3 and 25% in S4.

6.9 Effects of Sample Matrix

Samples S1 and S2 were soil samples and Samples S3 and S4 were water samples. Spiked water Sample S4 had the lowest percentage of numerical results for which z-scores were calculated, which may be due to low level of some analytes in this sample (below the LOR of some participants).

Sample S1 had a high percentage of satisfactory z-scores, meaning that laboratories were able to overcome matrix effects due to the high level of PFOS in the sample (Table 92).

Table 92 Satisfactory z-Scores for Each Matrix

Sample		Expected number of z-scores	Actual number of z-scores (% of expected no of z-scores)	Satisfactory	Satisfactory (%)
S1 Soil	Incurred	403	354 (88%)	325	92
S2 Soil	Spiked	744	576 (77%)	540	94
S3 Water	Incurred	429	373 (87%)	336	90
S4 Water	Spiked	693	515 (74%)	453	88

6.10 False Negatives

Appendix 4 presents false negative results. These are analytes present in the samples which a participant tested for, but did not report a numerical result (e.g. laboratories reporting a ‘less than’ (<) or NR result when the assigned and spiked value was higher than the participants’ reporting limit, or participants that did not report any value). For analytes where no assigned value was set, results have only been considered to be false negatives where the robust average and spiked value were significantly higher than the participants’ LOR, or if no value was reported.

6.11 Comparison with Previous PFAS in Soil and Water

In the first study conducted by NMI for PFAS analytes in soil and water AQA 15-03, participants were asked to report results for total and linear PFOS and PFOA only. 11 laboratories enrolled and 10 reported results. The lack of mass-labelled linear and branched standards was the main problem encountered by participants. Since then, a large number of high-quality standards and labelled standards have become available and so more analytes have been added each year to follow-up PT studies. Laboratories have developed methods for the analysis of a wide spectrum of PFAS contaminants and in general the reported results were compatible, showing that the mass-labelled standards are capable of correcting for the differences between these methods. A summary of participation and reported results rates in PFAS in soil and water over the last 7 studies (2015 to 2021) is presented in Figure 121.

AQA 21-07 is the seventh NMI proficiency test of PFAS analytes in soil and water. For all analytes, the same fixed target standard deviation was used in the present study as in previous studies. This allows for a comparison of participants' performance over time and provides a benchmark for progressive improvement. Participants' performance in the measurement of PFAS analytes in soil and water over time is presented in Figure 122.

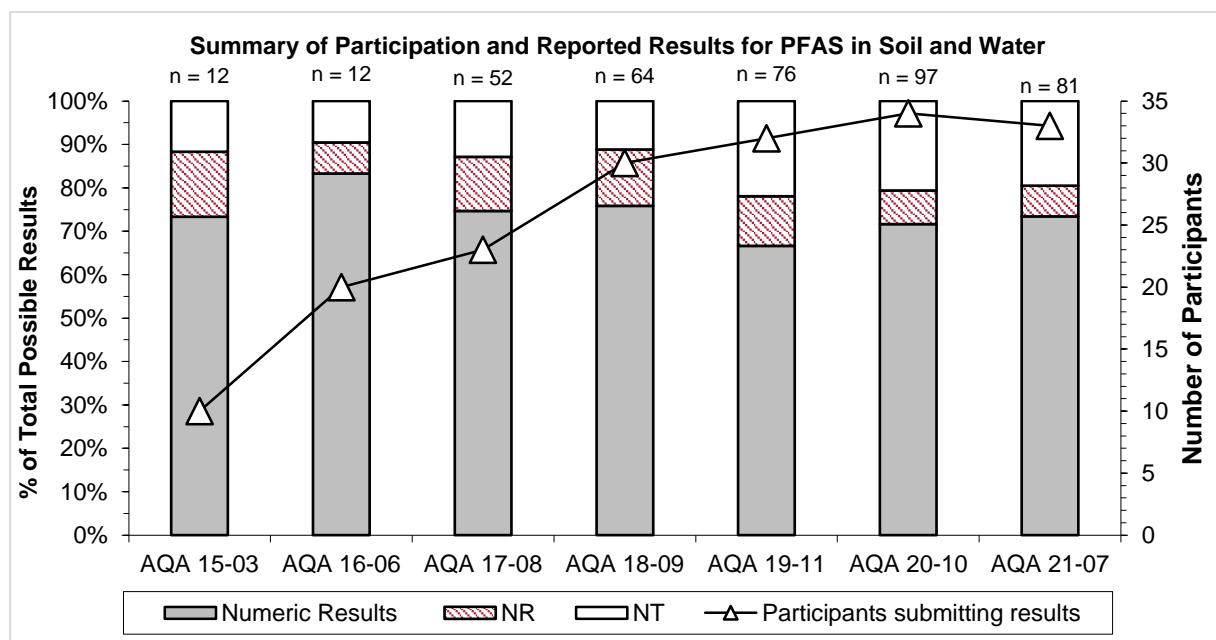

Figure 121 Summary of Participation and Reported Results for PFAS in Soil and Water PT Studies (n = number of analytes).

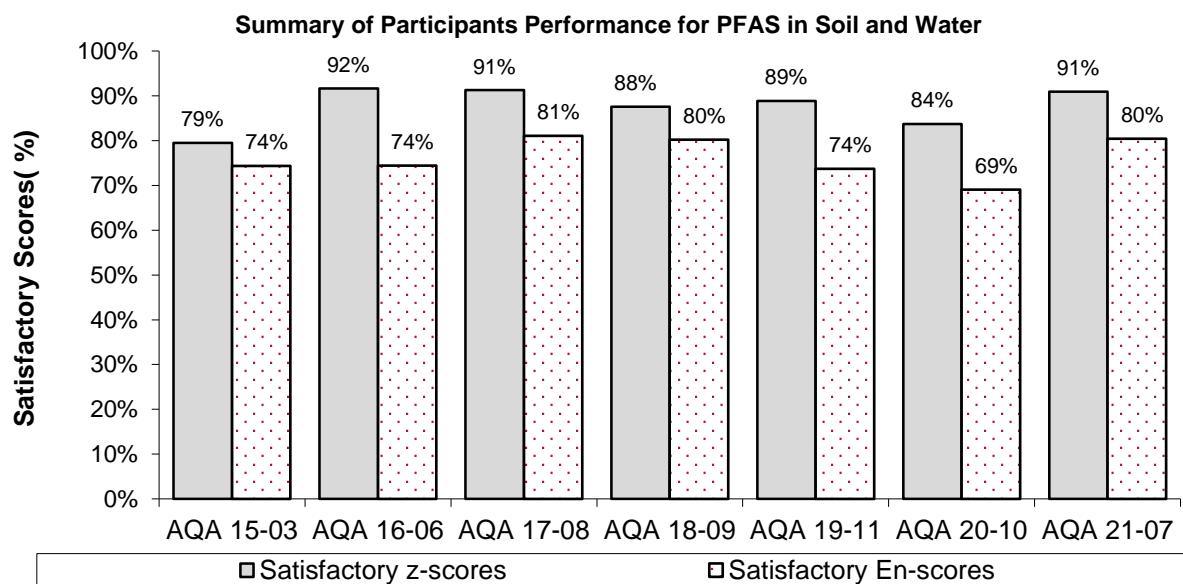

Figure 122 Summary of Participants' Performance for PFAS in in Soil and Water PT Studies

Over time, laboratories should expect at least 95% of their scores to lay within the range $|z| \leq 2.0$. Scores in the range $2.0 < |z| < 3.0$ can occasionally occur, however these should be interpreted in conjunction with the other scores obtained by that laboratory. For example, a trend of z-scores on one side of the zero line is an indication of method or laboratory bias. Individual performance history reports are emailed to each participant at the end of the study; the consideration of z-scores for an analyte over time provides much more useful information than a single z-score.

APPENDIX 1 – SAMPLE PREPARATION

A1.1 Sample Preparation

Sample S1: Two contaminated soils were separately dried and sieved through a 850 µm sieve and collected on a 355 µm sieve. The two contaminated soil materials were mixed, divided into 20 – 25 g portions, packed into labelled Greiner tubes and shrink-wrapped.

Sample S2: 1300 g of dried and sieved uncontaminated soil was placed in a 3 L round bottom flask. A slurry was produced by adding acetone. The slurry was spiked with a composite solution that had been prepared from stock solutions. Vials of Wellington Laboratories standards solutions were individually spiked. The slurry was placed on the Rotavap, and the acetone was evaporated off with a slight vacuum, with the heater being to no more than 40°C. The dry soil was divided into 20 – 25 g portions, packed into labelled Greiner tubes and shrink-wrapped.

Sample S3: Two contaminated water samples were filtered through a sterile 0.2 µm pore size filter into a pre-weighed 10 litre Schott Bottle. The final mass of filtered contaminated water was 6400 g. The water was autoclaved and then dispensed through a sterile 0.2 µm pore size filter into 60 mL HDPE bottles. The bottles were labelled, shrink-wrapped and refrigerated

Sample S4: 6000 g of autoclaved milli-Q water was spiked with a composite spike solution containing 18 analytes prepared in methanol. The spiked water was mixed for approximately 2 hours, and dispensed into labelled 65 mL HDPE bottles. Each bottle was then spiked with a composite solution containing PFUnA, PFDoA, PFTrA, PFTeDA, PFOSA, PFUdS, PFDoS and PFTrDS to minimise the loss of these analytes during preparation. The bottles were labelled, shrink-wrapped and refrigerated.

Soil and water samples were stored at 4°C prior to dispatch to participants.

APPENDIX 2– ROBUST AVERAGE AND ASSOCIATED UNCERTAINTY, Z-SCORE AND E_n-SCORE CALCULATIONS

A2.1 Robust Average and Associated Uncertainty

The robust average was calculated using the procedure described in ISO 13528:2015 Annex C.⁵ The uncertainty was estimated as:

$$u_{\text{rob average}} = 1.25 \times S_{\text{rob average}} / \sqrt{p} \quad \text{Equation 4}$$

where:

$u_{\text{rob average}}$ is the standard uncertainty of the robust average

$S_{\text{rob average}}$ is the standard deviation of the robust average

p is the number of results

The expanded uncertainty ($U_{\text{rob average}}$) is the standard uncertainty multiplied by a coverage factor of 2 at approximately 95% confidence level.

A worked example is set out below in Table 93.

Table 93 Uncertainty Estimate for PFHxA in Sample S1

No. results (p)	30
Robust Average	12.8 µg/kg
$S_{\text{rob av}}$	1.35 µg/kg
$u_{\text{rob av}}$	0.3 µg/kg
k	2
$U_{\text{rob av}}$	0.6 µg/kg

Therefore, the robust average for PFHxA in Sample S1 is **12.8 ± 0.6 µg/kg**.

A2.2 z-Score and E_n-Score Calculations

For each participant's result, a z-score and E_n-score are calculated according to Equations 2 and 3 respectively (see page 12).

A worked example is set out below in Table 94.

Table 94 z-Score and E_n-Score for Sample S1 PFHxA Result Reported by Laboratory 3

Participant Result (µg/kg)	Assigned Value (µg/kg)	Target Standard Deviation	z-Score	E _n -Score
12 ± 2.5	12.8 ± 0.6	20% as PCV, or: 0.2 × 12.8 = 2.6 µg/kg	$\text{z-Score} = \frac{12 - 12.8}{2.6} = -0.31$	$\text{E}_n\text{-Score} = \frac{12 - 12.8}{\sqrt{2.5^2 + 0.6^2}} = -0.31$

Table 139 Participant Methodology for Soil Samples– Additional Information

Lab. Code	Sample	Additional Information
6	S1 and S2	ALL submitted data are based on the anion-basis
7	S1 and S2	A note on these results: Instrument failure resulted in the extraction of these samples being halted midway (sample loaded onto SPE) they were held there for two weeks.
15	S1	Extra compounds detected < LOR ; PFOSA 2.2 ug/kg
	S2	Extra compounds < LOR; PFOSA 4.7 ug/kg
17	S1	PFOS concentrations based on 10x dilution of extract. PFOS recovery is based on the undiluted extract.
24	S1	PFTeDA and 8:2 FTS are not reported (NR) because of a high internal standard recovery. ADONA is not reported (NR) because of a poor recovery of our QC sample.
	S2	PFTeDA is not reported (NR) because of a high internal standard recovery. ADONA is not reported (NR) because of a poor recovery of our QC sample.
25	S1	All linear and branched have been reported although some branched peaks are not confirmed by traceable standards.
27	S1	All linear and branched have been reported although some branched peaks are not confirmed by traceable standards
30	S1	PFNS, PFDS, PFDoS, FOSA, Branched Isomers detected, reported total. Isomers confirmed by Obirt-Trap DDMS.

APPENDIX 6 – PARTICIPANTS’ TEST METHODS FOR WATER SAMPLES

Participants’ methods for water samples are presented in Tables 140 to 182.

Table 140 Participant Methodology for Water Samples – Extraction

Lab. Code	S3 Entire Container/ Volume (mL)	S4 Entire Container/ Volume (mL)	Bottle Rinsed	Rinsing Solvent (if applicable)	Sample Pretreatment	Extraction Technique (Clean-Up)	Extraction Solvent	Elution Solvent (if applicable)	Extraction Temperature	Extraction Time
2	Entire container & 10mL	Entire container & 10mL	Yes	1:1 MeOH/DIW with 1% formic acid		Solid-Phase Extraction: Strata -X-AW		ACN 3% v/v amm hydrox; acetone	ambient

Table 182 Participant Methodology for Water Samples – Additional Information

Lab. Code	Sample	Additional Information
4	S4	PFDS from 50mL sample
6	S3 and S4	ALL submitted data are based on anion-basis
7	S3 and S4	A note on these results: Instrument failure resulted in the extraction of these samples being halted midway (sample loaded onto SPE) they were held there for two weeks.
15	S3	Extra compounds detected < LOR; PFOSA at 0.01 ug/L
	S4	Extra compounds detected < LOR; PFOA at 0.03 ug/L, PFDA at 0.04 ug/L, PFDoA at 0.02 ug/L, PFTeDA at 0.01 ug/L, PFOS at 0.01 ug/L, PFDS 0.04 ug/L
17	S3	PFOS (Total), PFHxS (Linear) and PFHxS (Total) were quantified using a direct injection sample. Other analytes were quantified using SPE extract
19	S3	This sample also required analysis by direct injection for PFOS and PFHxS (0.5mL diluted 1:1 with MeOH) as they were outside the calibration range of the SPE method
24	S4	PFNS, PFDS, PFTeDA, 6:2 FTS and 9Cl-PF3ONS are not reported (NR) because of a poor recovery of our QC sample
25	S3	All linear and branched present have been reported although some branched peaks are not confirmed by traceable standards.
27	S3	All linear and branched present have been reported although some branched peaks are not confirmed by traceable standards.
30	S3	S3: PFNS Isomer detected, report total. Isomers confirmed by Obirt-Trap DDMS.

APPENDIX 7 – ACRONYMS AND ABBREVIATIONS

10:2 FTS	1H, 1H, 2H, 2H-perfluorododecane sulfonate
11Cl-PF3OUdS	11-Chloroeicosfluoro-3-oxaundecane-1-sulfonic acid
4:2 FTS	1H, 1H, 2H, 2H-perfluorohexane sulfonate
6:2 FTS	1H, 1H, 2H, 2H-perfluorooctane sulfonate
8:2 FTS	1H, 1H, 2H, 2H-perfluorodecane sulfonate
9Cl-PF3ONS	9-Chlorohexadecafluoro-3-oxanonane-1-sulfonic acid
ACN	Acetonitrile
ADONA	Ammonium 4,8-dioxa-3H-perfluorononanoate
Alk Dig	Alkaline Digestion
ASE	Accelerated Solvent Extraction
ASLP	Australian Standard Leaching Protocol
AQA	Analytical and Quality Assurance
AV	Assigned Value
CRM	Certified Reference Material
CV	Coefficient of Variation
EPA	Environment Protection Authority
EtFOSA	N-Ethyl perfluorooctane sulfonamide
EtFOSAA	N-Ethyl perfluorooctane sulfonamido acetic acid
EtFOSE	N-Ethyl perfluorooctane sulfonamidoethanol
FOSA	Perfluoro-1-octanesulfonamide
GenX	Ammonium 2,3,3,3-tetrafluoro-2-(heptafluoropropoxy) propanoate
GUM	Guide for Uncertainty Measurement
HV	Homogeneity Value
IPE	Ion Pair Extraction
ISO	International Standards Organisation
ISTD	Internal Standard
LC	Liquid Chromatography
LC-MSMS	Liquid Chromatography with Tandem Mass Spectrometry
LCS	Laboratory Control Sample
LLE	Liquid-Liquid Extraction
LOR	Limit of Reporting
LSE	Liquid-Solid Extraction
Max	Maximum value in a set of results
Md	Median
MeFOSA	N-Methyl perfluorooctane sulfonamide
MeFOSAA	N-Methyl perfluorooctane sulfonamidoacetic acid
MeFOSE	N-Methyl perfluorooctane sulfonamidoethanol
MeOH	Methanol

MeOH/Base	Base modified methanol
Min	Minimum value in a set of results
MS	Mass Spectrometry
MTBE	Methyl tert-butyl ether
MU	Measurement Uncertainty
NATA	National Association of Testing Authorities, Australia
NMI	National Measurement Institute (of Australia)
NR	Not Reported
NT	Not Tested
PCV	Performance Coefficient of Variation
PFAA	Perfluoroalkyl acids
PFAS	Per- and poly fluorinated alkyl substances
PFBA	Perfluoro-n-butanoic acid
PFBS	Potassium perfluoro-1-butanesulfonate
PFCA	Perfluorinated carboxylic acids
PFDA	Perfluoro-n-decanoic acid
PFDoA	Perfluorododecanoic acid
PFDoS	Perfluorododecane sulfonate
PFDS	Perfluorododecane sulfonate
PFECA	Perfluoroalkyl ether carboxylic acid
PFESA	Polyfluorinated ether sulfonic acid
PFHpA	Perfluoro-n-heptanoic acid
PFHpS	Perfluoroheptane sulfonate
PFHxA	Perfluoro-n-hexanoic acid
PFHxS	Potassium perfluorohexanesulfonate
PFHxS_L	Potassium perfluorohexanesulfonate linear
PFNA	Perfluoro-n-nonanoic acid
PFNS	Perfluorononane sulfonate
PFOA	Perfluorooctanoic acid
PFOS	Perfluorooctane sulfonate
PFOS_L	Perfluorooctane sulfonate linear
PFOSA	Perfluoro-1-octanesulfonamide
PFPeA	Perfluoro-n-pentanoic acid
PFPeS	Perfluoropentane sulfonate
PFSA	Perfluorosulfonic acid
PFTeDA	Perfluorotetradecanoic acid
PFTrDA	Perfluorotridecanoic acid
PFTrDS	Perfluorotridecane sulfonate
PFUdA	Perfluoroundecanoic acid
PFUdS	Perfluoroundecane sulfonate

PLE	Pressurised Liquid Extraction
PT	Proficiency Test
PTFE	Polytetrafluoroethylene
Q	Quadrupole mass analyser
QC	Quality Control
QQQ	Triple Quadrupole (mass spectrometry)
QuEChERS	Quick, Easy, Cheap, Effective, Rugged and Safe extraction method
RA	Robust Average
RM	Reference Material
Robust CV	Robust Coefficient of Variation
Robust SD	Robust Standard Deviation
SD	Standard Deviation
SLE	Solid-Liquid Extraction
SPE	Solid Phase Extraction
SS	Spiked Samples
SV	Spiked or formulated concentration of a PT sample (Spike Value)
Target SD	Target standard deviation
TBA	Tert-butanol
TCLP	Toxicity characteristic leaching procedure
UHPLC	Ultra-High-Performance Liquid Chromatography
US EPA	United States Environmental Protection Agency
WAX	Weak Anion Exchange

END OF REPORT
