

# CERTIFIED REFERENCE MATERIAL CERTIFICATE OF ANALYSIS

## NMIA D607b: Etiocholanolone-3-O- $\beta$ -glucuronide, sodium salt

Report ID: D607b.2023.01 (Ampouled 221027a)

Chemical Formula:  $C_{25}H_{37}NaO_8$

Molecular Weight: 488.5 g/mol

### Certified value

Batch No.

CAS No.

Mass per ampoule

15-S-14

3602-09-3 (free acid)

899  $\pm$  20  $\mu$ g

The uncertainty has been calculated according to ISO Guide 35 and is stated at the 95% confidence limit ( $k = 2$ ).

**IUPAC name:** Sodium (3 $\alpha$ )-17-Oxo-5 $\beta$ -androstane-3-yl  $\beta$ -D-glucopyranosiduronic acid.

**Expiration of certification:** The property values are valid till 1 December 2026, three years from the date of re-certification provided the **unopened** material is handled and stored in accordance with the recommendations below. The material as issued in the unopened container and stored as recommended below should be suitable for use beyond this date, subject to confirmation of batch stability from the issuing body. The expiry date/shelf life does not apply to ampoules that have been opened. In such cases it is recommended that the end-user conduct their own in-house stability trials.

**Description:** The compound is supplied as a dried aliquot in a sealed ampoule under an atmosphere of argon. The CRM is intended for a single use to prepare a standard solution containing D607b. This material was prepared by synthesis and certified for identity and purity by NMIA.

**Intended use:** This certified reference material is suitable for use as a primary calibrator.

**Instructions for use:** Open the ampoule and carefully rinse the interior at least three times with a suitable organic solvent (e.g. methanol). This will transfer 899  $\pm$  20  $\mu$ g of anhydrous etiocholanolone-3-O- $\beta$ -glucuronide, sodium salt. The mass of analyte in each ampoule is calculated from the assigned purity of the bulk and the concentration of bulk material in a stock solution used to prepare the ampoules.

**Recommended storage:** When not in use, this material should be stored at or below 4  $^{\circ}$ C in a closed container in a dry, dark area.

**Metrological traceability:** The certified purity value is traceable to the SI unit for mass (kg) through Australian national standards via balance calibration. In the mass balance approach all impurities are quantified as a mass fraction and subtracted from 100%. Quantitative NMR provides an independent direct measure of the mass fraction of the analyte of interest, calibrated with an internal standard certified for purity (mass fraction).

**Stability:** This material has demonstrated stability over a minimum period of three years. The measurement uncertainty at the 95% confidence interval includes a stability component which has been estimated from annual stability trials. The long-term stability of the compound in solution has not been examined.

**Homogeneity assessment:** The homogeneity of the material was assessed using purity assay by UHPLC with charged aerosol detection on seven randomly selected ampoules of the material. The material was judged to be sufficiently homogeneous at this level of sampling as the variation in analysis results between samples was not significantly different at a 95% confidence level from that observed on repeat analysis of the same sample.

**Safety:** Treat as hazardous substance. Use appropriate work practices when handling to avoid skin or eye contact, ingestion or inhalation of dust. Refer to the provided safety data sheet.

|        | Initial analysis:                         | Mean = 99.07%, s = 0.06% (7 sub samples in duplicate, November 2022)                        |
|        | Re-analysis:                              | Mean = 99.24%, s = 0.04% (5 sub samples in duplicate, December 2023)                        |

**The following analytical data was obtained on the bulk material subsequently used in the preparation of the ampoules.**

The identity was confirmed by a range of spectroscopic techniques, NMR, IR and MS. The certified purity value was obtained by quantitative nuclear magnetic resonance (QNMR) using the one proton doublet at 4.64 ppm against a certified internal standard of potassium hydrogen maleate.

Supporting evidence is provided HPLC with ELS detection, Karl Fischer analysis, <sup>1</sup>H NMR and elemental microanalysis.
